OPERATIONS MANUAL

The Nauti Yachti — Website and Owner Console

How to run a charter business on this system: the public website, the owner console at thenautiyachti.com/admin, and the AI crew that watches over both.

Edition for version 3.4.0 · October 2026

Contents

About this manual

How to use this manual

Conventions used in this manual

Keeping this manual true

Part 1 — The system at a glance

1.1 What the system is

1.2 How the pieces connect

1.3 Signing in and the top bar

1.4 How the console is laid out

1.5 The Overview screen

1.6 A day in the life

Part 2 — The public website

2.1 The pages and what each is for

2.2 How a guest books

2.3 How prices are worked out

2.4 What happens when a guest pays

2.5 The emails the site sends

2.6 Seat-sale events

2.7 The availability check

2.8 The trip page

Part 3 — Bookings

3.1 The booking lifecycle

3.2 Booking numbers

3.3 The Bookings tab

3.4 Lead source, channel and how they paid

3.5 Taking a booking that came in by text or phone

3.6 Platform bookings: Boatsetter and GetMyBoat

3.7 Charging a booking and payment links

3.8 When the same guest appears twice

3.9 Owed: paid for, never sailed

3.10 Availability and blocking days

3.11 Completing a charter

3.12 Capacity counts the captain

3.13 When a payment and the console disagree

Part 4 — Money

4.1 Income & expenses
4.2 Origin: how the money moved
4.3 Reconciliation
4.4 Tax Report
4.5 The bank balance
4.6 Gift certificates
4.7 Subscriptions & bills

Part 5 — Guests

5.1 Contacts
5.2 Asking for reviews
5.3 Testimonials
5.4 Photo Requests
5.5 Charters we owe

Part 6 — Photos, video and social media

6.1 The photo library
6.2 Photos guests send you
6.3 The public gallery
6.4 Social posts: from draft to published
6.5 What each platform will take
6.6 Comments
6.7 Messages

Part 7 — The AI crew

7.1 Who they are and when they run
7.2 What none of them may do
7.3 The Board
7.4 Status cards and voices
7.5 Who checks whom
7.6 Where their instructions live, and how to change them
7.7 Working with Claude

Part 8 — Fleet and on the water

8.1 Boats and docks
8.2 The On the dock page
8.3 Arriving guests and the gate code

8.4 Reviews on the phone
8.5 Boat log: hours, fuel and service
8.6 Maintenance

Part 9 — Running and protecting the system

9.1 Versions and releases
9.2 Where everything lives
9.3 Backups and disaster recovery
9.4 The checks that keep it honest
9.5 Setup: packages, add-ons and coupons
9.6 Names that look out of date

Part 10 — Troubleshooting

10.1 Bookings and payments
10.2 Posts, comments and messages
10.3 The crew
10.4 Files, email and the system

Appendices

Appendix A — Quick reference
Appendix B — Glossary
Appendix C — This installation: The Nauti Yachti
Appendix D — Setting this up for another business

About this manual

How to use this manual

This is an operations manual. It tells you what each part of the system is for, how the logic behind it works, and what to do, step by step, for the jobs that come up. It is written for the owner and for anyone the owner trusts to run the business with them.

It is organised the way the work is, not the way the system was built:

Part	Read it when you need to…
1 · The system at a glance	understand what the pieces are and find your way around the console
2 · The public website	know what a guest sees and what happens when they book or pay
3 · Bookings	take, change, charge, complete or untangle a booking
4 · Money	record income and costs, reconcile, or produce tax figures
5 · Guests	reach past guests, ask for reviews, answer photo requests
6 · Photos, video and social media	find media, approve posts, answer comments and messages
7 · The AI crew	understand the agents, their board and their limits
8 · Fleet and on the water	use the phone page on the dock, log hours and maintenance
9 · Running and protecting the system	releases, backups, files, and the checks that keep it honest
10 · Troubleshooting	something looks wrong and you want the fix
Appendices	quick reference, glossary, this installation's specifics, and setting it up for another business

New to the system? Read Part 1, then Part 3. Everything else can be looked up when it comes up.

Conventions used in this manual

- **Bold** names a button, tab or label exactly as it appears on screen.
- **Group** → **Tab** gives a path through the console, for example **Bookings** → **Availability**.
- `Monospace` is a file, a script or a value typed exactly as shown.
- Numbered steps are a procedure: do them in order.

> **Why it works this way.** Boxes like this explain the reason behind a rule. Most rules in this system exist because something went wrong once. The box tells you what, so you can judge the edge cases the rule does not cover.

Facts that belong to this one business (its boats, docks, packages and accounts) are collected in Appendix C. Everything else describes how the system works and holds for any business running it.

Keeping this manual true

The manual lives in the app as `owner-console-manual.md`, and the **Manual** button in the console opens a PDF built from it. Three things keep the two honest:

- A check compares the tab names in How the console is laid out with the tabs the console really has, and fails the release if they differ.
- A check fails if the PDF no longer matches the text it was built from.
- The manual is re-read at every release, and a stamp records the version it was last read against.

If you notice something here that is no longer true, say so. A wrong sentence in a manual is worse than a missing one.

Part 1 — The system at a glance

1.1 What the system is

The system has three parts that share one database.

Part	Who uses it	What it does
The public website	guests	shows the boats, packages and prices, takes inquiries and card payments, sells gift certificates, collects crew-list signups and guest photos
The owner console	you	every booking, every dollar, every post and message, and the crew's to-do board, at `/admin`
The AI crew	runs on its own, on a schedule	eight agents and two routines that check the books, draft social posts, publish what you approved, chase reviews and report what needs you

Around them sit outside services, each doing one job:

Service	Its job
Stripe	takes card payments and tells the site when one succeeds or fails
Resend	sends the website's emails
Blotato	publishes posts to Facebook, Instagram and TikTok, and reads comments and messages
ElevenLabs	the crew's spoken voices, when you click an agent to hear her
Supabase	the database
Vercel	hosts the website and the console
Google Drive	backs up the business files, the photo library and the crew's instructions
GitHub	backs up the code, with every version tagged

> **Why it works this way.** Every outside service holds one job, so a failure is easy to place. If posts stop, it is Blotato. If confirmations stop, it is Resend. If payments stop, it is Stripe.

1.2 How the pieces connect

A booking shows the whole chain:

1. A guest fills in the form on the website. The site prices it and writes an **inquiry** into the database.

2. The guest gets an acknowledgement email, and you get a copy.
3. You agree the details and send a payment link. The guest pays through Stripe.
4. Stripe tells the site. The site marks the booking paid, blocks the date on the calendar and emails a confirmation.
5. After the trip you mark it **completed**. The income is written into the ledger on its own.
6. The next morning the crew checks the money arrived, lists the guest among those to ask for a review (you send the request), and suggests a post from the photos.

Nothing in that chain needs you to copy a number from one screen to another. Where you do have to step in, the console tells you: that is what the numbers on the tabs are for.

1.3 Signing in and the top bar

Open `/admin` on the website and enter the passcode. The passcode is not written in this manual or anywhere in the system's files. If your session times out, the console says so and asks you to sign in again.

The bar along the top:

Item	What it does
Version badge	The version of the whole system, for example `v2.13.0`. The same number sits under the Owner console link on the public site. Hover for details. See 9.1 Versions and releases.
📱 **On the dock**	The phone page for the boat: weather, guests arriving, review asks, engine hours and fuel. See Part 8.
📖 **Manual**	Opens this manual as a PDF.
← **Back to site**	The public website.
Log out	Ends your session.

A muted-speaker notice appears only if the crew's speech fails. Click it to dismiss it.

1.4 How the console is laid out

Six groups run along the top. Clicking a group shows its tabs underneath.

Group	Tabs
Overview	the day at a glance: what needs you, money, guests, the fleet, the board and the crew
Bookings	Contacts · Bookings · Availability
Money	Income & expenses · Reconciliation · Tax Report · Gift certificates · Subscriptions & bills
Marketing	Media · Media Drafts · Comments · Messages · Testimonials · Photo Requests
Setup	Packages & pricing · Add-ons · Coupons
Boat	Maintenance

A number after a tab or group name means something is waiting on you. No number means nothing needs doing. It does not mean the tab is empty: Testimonials can hold every approved review and still show no number. The number on **Overview** counts agents waiting for your answer.

If a panel cannot load, a pink **Some panels did not load** banner says so instead of showing blanks.

1.5 The Overview screen

The Overview is where to start every day. On a wide screen it has three columns; on a phone it stacks. Most panel headings are links to the tab that can act on them.

Crew alerts appear at the very top, only when there is something to say: an agent **Waiting on you**, or one that failed, stopped mid-run, has gone quiet, or has no standup filed. To restart an agent, open the scheduled routines in the Claude app and choose **Run now**.

Panel	What it shows
Needs attention	Every item waiting on you, each a link to where it can be fixed: new inquiries, maintenance due, approved posts with no date, drafts to approve, completed charters with no price, posts going out in the next three days, guests never asked for a review, income not tied to a charter, bills due within two weeks, past guests with no phone. Urgent lines are bold orange. When it says *Genuinely nothing waiting*, there is nothing.
Money	The bank balance as last recorded and how old the reading is, income earned this season, money held for trips that have not happened, costs, net, monthly fixed costs, break-even in charters per month, and this month so far.
Guests	Reviews and the average rating, how many guests can be reached, and **Charters we owe** when anyone has paid for a trip that never ran.
Pearl	The lead agent's morning summary. Click her face to hear it.
The Board (To-do List)	The shared to-do list between you and the crew. See 7.3.
Research	Anything the research agent has found that cleared her bar. Usually *Nothing has cleared the bar*, which is normal.
The fleet	The next charter out, trips and earnings per boat this season, and idle days.
Going out next	The next posts due, how far ahead the queue runs, and the last confirmed publish.
Money on the table	Open Saturdays in the next eight weeks, gift certificates sold and revenue ideas open on the board.

Each panel carries the face of the agent who owns that area. At the bottom, a chart shows who reports to whom.

1.6 A day in the life

A routine that keeps everything current with the least effort.

Every morning, five minutes:

1. Open **Overview**. Work down **Needs attention** from the top.
2. Read Pearl's summary, or click her face to hear it.
3. Glance at **The Board** for anything marked High.
4. Open **Marketing → Media Drafts** if the badge shows posts waiting for approval, and approve, discuss or deny them (once approved, a post can also be rescheduled).

On a charter day:

1. Open 📱 **On the dock** on your phone.
2. On **Arriving**, text each guest the dock details and gate code.
3. Before heading out, and whenever weather builds, check **Weather** → **Can I get back before it hits?**

After every charter:

1. In **Bookings**, set the charter to **completed**. That writes its income.
2. On the phone page, log engine hours (**Boat log**) and any fuel.
3. Text the guest for a review from **Reviews**, ideally the same day.

Once a week: reconcile platform payouts (**Money** → **Reconciliation**), file receipts (**Money** → **Income & expenses**), and record the bank balance.

Part 2 — The public website

2.1 The pages and what each is for

Page	What it is for
`/` (home)	the boats, the packages, the gallery, the reviews, and the booking form at the bottom
`/packages`	each package in full
`/glow`	the seat-sale event page: the date and the seats while it is on sale, the crew-list signup always. See 2.6
`/events`	upcoming events
`/faq`, `/about`, `/terms`, `/privacy-policy`	questions, the business, the terms and waiver, privacy
`/gift-certificates`	buying a gift certificate
`/share-your-photos`	anyone uploads photos and video from a trip; it points booked guests to Guest Login. No longer in the menu
`/trip/<booking number>/<key>`	the guest's own trip page: times, meeting point, payment, photo box, review and messages. See 2.8
`/trip`	**Guest Login**, in the menu on every page: a guest signs in with their booking number and phone and lands on their trip page, or picks from all their trips if they have been out more than once
`/thanks`	after a trip, from the on-boat QR code: ask for photos, leave a review
`/pay/<id>`	the payment page you text a guest, see 3.7
`/booking-success`	where a guest lands after paying

A link with `?package=<id>` opens the home page with that package already chosen in the form. A link with `?from=<source>` records where the guest came from, which ends up as the booking's lead source.

2.2 How a guest books

The home page walks the guest through **three steps** (since 15 October 2026), named in the hero as "Booking is 3 easy steps":

1. **Pick your vessel.** Tapping a boat takes them to step 2.

2. **Pick your package.** The prices shown are for the boat they picked. **Choose this package** takes them to step 3 (a seat-sale event goes straight to the booking form, because its date is fixed).
3. **Pick your date & time.** The calendar shows this month and next, and **Later months** pages up to a year ahead. Tapping an open or partly booked day opens a small panel: how long, and an estimated start time. A start time that overlaps a charter already booked at a known time is shown as *taken* and cannot be chosen. **Continue to book** fills the booking form with everything chosen so far.

The booking form is at the bottom of the home page, headed **Your charter**, with the review form beside it on a wide screen (below it on a phone). One small box at its top says replies are same-day, the cancellation terms, and the phone number.

The guest fills in: the package, the boat (only boats that run that package are offered), the date, the hours (for hourly packages), the estimated start time, party size, any add-ons, then name, email, phone and a message, then an optional coupon code and gift certificate code, and ticks to accept the terms. For a fixed-date event the date and time are set for them, and once that date has passed the event is not offered at all (see 2.6).

The price is on the button and updates as they choose: **Book & pay now · $830**. A coupon or gift certificate is checked as soon as they leave its box, and the total above the button shows the charter, the discount and what is due today. That is a preview; the server prices it again and applies the codes itself.

The start time reaches you at the top of the inquiry's message ("Preferred start time: 1pm"), and on a paid booking it is written into the booking's start time, so the calendar shows the window and the confirmation email states it.

Then they pick one of two buttons:

Button	What happens
Book & pay now	The site re-checks the price on the server, records the inquiry, and sends the guest to Stripe to pay. If card payments are switched off it falls back to sending an inquiry.
Not ready to pay? Just send an inquiry	The inquiry is recorded with status **new**, and both of you get an email. You follow up.

Either button first checks that the boat is free (see 2.7). If it is not, the guest is told why on the spot, for example that the boat only has three hours left that day, and nothing is recorded.

The site confirms on screen and the confirmation stays there. The form is replaced by a panel that reads back what they asked for and says no more is needed, so nobody fills the form in twice thinking it failed.

The same inquiry sent twice

A plain inquiry that matches one already waiting is folded into it instead of making a second row. It counts as the same inquiry when all of these match:

Must match	Within
email, requested date, package and **boat**	30 minutes of the first, and only while the first is still **new**

If they changed something (party size, phone, message), the row is updated and you get one email headed **Updated inquiry**. If they changed nothing, you hear nothing more. The guest never gets a second acknowledgement. An inquiry with no date is never merged.

> **Why it works this way.** The boat is part of the test because a large group sometimes books two boats for the same day, half an hour apart. Leaving the boat out would merge two real bookings into one. A second row you delete costs a click; a lost booking costs a charter.

Known limit: Book & pay now does not de-duplicate. Every press makes a new inquiry. See 3.8.

Known limit, accepted: one guest can be charged twice for one booking, by paying through two checkouts. Nothing stops it, by the owner's choice: the guest will notice and say so, and the fix is quick. Refund the second charge in Stripe, then cancel the extra row. The merge tool refuses a pair that both carry money, so this one is done by hand (see 3.8).

2.3 How prices are worked out

Every price lives in the database, in Setup → Packages & pricing. The website, the payment page and the checkout all compute from it. A price written anywhere else, such as a flyer or an old price card, is only a copy.

Each package is priced one of four ways:

Pricing type	How the price is found
Hourly by vessel	a grid per boat: hours × weekday or weekend. **Friday, Saturday and Sunday are the weekend** (Friday since 15 October 2026, your decision); holidays are not treated specially.
Per guest	party size × price per guest. Used for seat-sale events.
Tiered by guests	one flat price for the size band the party falls in
Flat	one price

If a combination has no price (a boat or a number of hours missing from the grid), the site **refuses** rather than quoting $0.

The server re-prices every checkout. If the server's price is higher than what the guest's screen showed, the checkout stops with a "the price changed" message. If it is lower, the lower price is charged.

Add-ons

Extras a guest can add. Which ones come free with which package, and their prices, are set in **Setup → Add-ons** and in `lib/addOns.js`, which is the single source for the form, the quote and the FAQ. This installation's list is in Appendix C.

- A bundle that contains other add-ons is never charged twice for what it contains.
- **A per-guest event takes no add-ons at all.** There is no table to decorate for one seat on a shared boat, so the form hides them and the server ignores them.
- A charter with no stated occasion is the default package, not a guess. See Appendix C.

Coupons

Codes are made in **Setup → Coupons**: a percentage or a fixed amount off, with an optional end date, usage limit, and "returning guests only".

- A code is checked when the guest checks out. A code that is unknown, inactive, expired or used up is **silently ignored** and the full price is charged.
- "Returning guests only" means the email must match an earlier paid booking.
- A discount never takes the price below zero.

Known limit: a use is counted when the checkout **starts**, not when the guest pays, so an abandoned checkout still uses one. Watch the count on a code with a small limit.

Gift certificates at checkout

A guest can enter a gift certificate code in two places: the booking form, beside the coupon box, and the payment page you text them, under **Have a gift certificate?**. The code is checked as they type it and the balance is shown.

Coupon codes work on the payment page too (since 10 Oct 2026), under **Have a coupon code?**, so a guest you text a `/pay` link can use a code such as LASTCALL20 themselves. The total updates as soon as the code is applied, and a code that cannot be used (expired, used up, or for returning guests only) shows its reason instead of quietly charging full price. The coupon comes off first, then any gift certificate. A use is counted only when the payment goes through, so a guest opening their link several times does not use up a limited code. Nothing is discounted unless the guest types the code: the price on the booking stays as you set it.

- The certificate is applied **after** any coupon, against whatever is still owed.
- It is **spent only once the rest is paid**, so an abandoned checkout never uses it. When it covers the whole charter there is nothing for the card to pay, so it is spent at once, the booking is marked paid by gift certificate, and the guest gets their confirmation.
- A code given with a plain inquiry is kept on the inquiry, shown in your inquiry email, and filled in on the payment page when you send the link. It is not spent until they pay.

See 4.6.

2.4 What happens when a guest pays

1. The guest pays on Stripe's page. Stripe collects their phone and their acceptance of the terms.
2. Stripe tells the site. The site checks once more that the boat is still free (see 2.7), then marks the inquiry **booked** and **paid**, records the payment method as card, and saves the phone, email and terms acceptance.
3. It creates the matching row in **Bookings**, with the same booking number. That row is what blocks the date on the calendar.
4. It emails the guest their confirmation, with you copied, and records that it was sent.

No income is written at payment. Income is written when the charter is marked **completed** (see 3.11), so money for a trip that has not happened is never counted as earned.

When a payment is declined

If the guest's bank refuses the card, the booking is marked **payment failed** with the reason and the time, and **you** get an email. The guest is not emailed by the site: Stripe already told them on the spot. The booking is not cancelled and the seat is not released, because a Stripe payment link stays usable for a day and most declines are retried.

On the booking you get a **Text** button whose message says the seat is still held and **never says why** the card was declined. The badge clears itself when a payment succeeds. A fault that is the business's (an expired key, an amount Stripe refuses) arrives as **PAYMENT BROKEN OUR END** instead.

2.5 The emails the site sends

When	The guest gets	You get
an inquiry is sent	an acknowledgement	the inquiry, or **Updated inquiry** for a changed duplicate
a checkout starts	an acknowledgement	the inquiry
a payment succeeds	the booking confirmation	a copy of it
a card is declined	nothing from the site	a notice saying what to send
someone joins the crew list	a welcome, with how to unsubscribe	a copy, and a signup notice
a gift certificate is bought	the certificate and how to use it; so does the person it is for, when the buyer gives their email	one notice: the code, the value and who it reached
a guest paid for a boat that was already taken	nothing from the site	an **ACTION** email: move them or refund them
a refund goes through on Stripe	nothing from the site	a notice of what was recorded
a guest writes on their trip page	nothing until you reply	a notice, saying whether a reply has been drafted
you reply on a trip page	your reply, by email, when the booking has an address	nothing

The confirmation tells the guest where to go and when. The meeting point is chosen by package first, then by boat: an event with its own meeting point uses it for every boat; otherwise each boat's own dock address is used. A boat with no address set is never given another boat's. Its guest is told the meeting point is coming, which costs one text and cannot send anyone to the wrong shore. Guests may also be picked up anywhere on the lake by arrangement; the business suggests its own dock, and an agreed pickup goes in the booking's note. **The dock gate code is never emailed**, because emails are forwarded and kept forever. It goes by text on the morning (see 8.3).

The confirmation links to the guest's trip page (2.8), which carries everything in the email plus the photo box and the message board.

Automatic emails sign as the business. Texts you send from your own phone carry your name.

If confirmations ever stop arriving, see Troubleshooting.

Known limit: no email goes out when a booking's status changes (except a full refund through Stripe, which emails you), when a charter completes, or for photo requests and guest uploads.

2.6 Seat-sale events

A seat-sale event is a package priced **per guest** with a fixed date: one night, many parties, each buying seats on a shared fleet. This installation has one, described in Appendix C.

Seats are counted, never typed in. The count reads every booking on the night, in both tables, each charter once:

Shown as	Counts
Confirmed	booked or completed
Tentative	an inquiry, a lapsed inquiry, an owed charter, or any status the system does not recognise
Available	capacity, minus confirmed, minus tentative

Capacity is the event's boats, less one seat per boat for the captain. A cancelled booking holds nothing. The same numbers show on the event page, on the Events page and under the package in **Setup → Packages & pricing**, for example *12 confirmed · 18 tentative · 10 available*. The event page refreshes them every minute.

> **Why it works this way.** A tentative seat counts against capacity because promising a seat to a second person while the first has not paid is how somebody gets turned away at the ramp. Showing it separately says how much of the night is really settled. A lapsed inquiry keeps its seats until you cancel it, so cancel the ones you know are not coming, or they hold seats nobody will sit in.

Sales close by themselves once the night has passed, at midnight lake time, and reopen only when the package is given its next date. While they are closed:

- the event page says the next date is coming, and every button on it goes to the crew-list signup, which stays open between seasons;
- the booking form does not offer the event, and an old link with `?package=` opens the home page without it;
- the checkout and the inquiry route refuse it, so a page left open from before, or a hand-made request, cannot buy a seat.

The server also refuses a seat-sale booking for any date other than the event's own.

To reopen, give the package its next date. Sales open the moment it is saved, so do not set a date before you want to sell seats.

Known limit: the event date cannot be changed from the console yet. Ask Claude to set it.

2.7 The availability check

The server checks that the boat is free, three times. The calendar on the home page only shows availability; it does not stop anyone choosing a day. The check is what does.

When	What is checked
a guest presses either button on the booking form	the whole request
a payment link is opened for a booking that does not yet hold its day	that booking, leaving itself out
the money arrives	that booking again, as a backstop

For a charter, the boat's day must not be blocked, it must have the hours asked for left, and the start time the guest picked must not overlap a charter already booked at a known time. A day holds eight hours, the same figure that turns a calendar square from partial to full (3.10). **For a seat-sale event**, the party must fit the seats available (2.6).

A guest on Stripe's payment page holds their boat. For 35 minutes from the moment they press **Book & pay now**, their hours count against the day, and Stripe's page itself closes after 30. So a second guest cannot slip in behind somebody typing a card number. A plain inquiry holds nothing.

If the money arrives for a boat that is no longer free (two guests at the same instant, or a booking you logged by hand while they were paying), the booking is marked **paid but not booked**, the guest is sent no confirmation, and you get an email headed **ACTION**. Call them: move them to another boat or date and mark it booked, or refund them in Stripe. The morning check keeps showing it until you do.

Not checked: a booking you add in the console yourself, and a payment link for a booking you have already marked booked. Both are your decision.

> **Why it works this way.** A website booking names a boat, a day, a number of hours and, since 15 October 2026, an estimated start time. The time can only be checked against bookings that have a start time of their own, so the hours-left test still does most of the work.

Known limit: a booking with no start time cannot clash with a start time; it is still counted against the day's eight hours. Add start times to bookings to make the time check complete.

> **Also:** If the check itself cannot run, for example because the database does not answer, the booking goes through as it did before the check existed: refusing every guest because of a fault would cost more charters than it saves.

2.8 The trip page

Every booking with a booking number has its own page for the guest: `thenautiyachti.com/trip/<booking number>/<key>`. It is the page they open before, on and after the day.

When	The page leads with
before the day, and on it	the charter, how to get there and when to arrive, payment, what to bring, the photo box, messages, and the common questions
afterwards	**our photos of their trip** (from the charter's `Completed` folder), the photo box, a **Leave a Google review** button, then the charter and payment
cancelled or refunded	that it was cancelled, and how to reach you
not yet confirmed	that the date is not held until it is paid, with the payment button

How a guest gets in. Two ways, and neither needs a password. The link in the booking confirmation email and in **Text reminder** signs them straight in. Or **Guest Login** in the website's menu, on every page, asks for their booking number and the phone number on the booking. Any number on the booking works. After five wrong tries from one connection it makes them wait, and the wait doubles with each further try.

A returning guest sees all their trips. When the phone they sign in with is on more than one booking, Guest Login lists every trip on it, newest first, marking the upcoming ones and the one they asked for; each opens its own trip page with its own photos. Cancelled trips, enquiries that never booked and unpaid website requests are left out. A trip page itself never lists the others: its link is often forwarded to the whole party, who were not all on the booker's other trips, so every trip page carries the same line pointing to Guest Login instead.

Known limit: trips are matched by phone. A booking with no phone on file, or a different one, does not join the list; add the phone to the booking and it does.

> **Why it works this way.** A booking number is the date and a counter, so anyone could guess the next one. The key on the end of the link is what keeps the page closed, and the phone number does the same job for a guest without the link. A password nobody remembers at a boat ramp would lock out more guests than strangers.

To see one without opening a guest's, use **See an example trip page** in Marketing → Messages. It is a made-up booking on a real boat, and it opens only while you are signed in to the console; anyone else gets "not found". Add `?phase=today`, `?phase=past` or `?glow=1` to its address to see the other states.

Anyone holding the link is the guest. That is deliberate: the person who booked forwards it to the group, and everyone aboard can send their photos. The page says so beside the message box.

What it shows, and what it never shows.

- Times and the meeting point come from the same place as the confirmation email (2.5), so the two cannot disagree. A glow seat is always sent to the event's meeting point. A boat with no address set says the meeting point is coming.
- **The gate code is never on it.** It still goes by text on the morning (8.3).

- Website and direct bookings show the charter price, any discount or gift certificate, and what was paid. An unpaid balance has a **Pay** button that goes to the booking's `/pay/<id>` page, never to Stripe directly.
- **Boatsetter and GetMyBoat bookings show no amounts**, only that the platform took the payment. What reaches you from a platform is not what the guest was charged.
- **Add time** (on a booked website or direct charter, in **Bookings**): when a guest wants to stay out longer, press **Add time** and enter the extra hours. The console prices only the difference on your own price table: for example, 3 hours at the weekday rate ($570) less the 2 already paid for ($400) is $170. Add-ons are per charter, so they are not charged again. It checks the boat is free for the extra time, then creates a separate charge with its own `/pay` link and a ready-made text: **Text pay link** on a phone, **Copy text + link** on a computer. The charge belongs to the same reservation: it takes the booking's number with **-X1** on the end (**-X2** for a second extension). It never becomes its own line in Bookings. Under the booking's price, **Payments** lists the original charge and each extension, marked **paid** or **unpaid** (an unpaid one links to its `/pay` page). When the guest pays, the booking's hours, price and amount paid go up by the extension, and its note records the payment. Mark the booking completed as usual and the whole amount reaches the ledger. If it was already completed, the extension's income is added to the ledger on its own row, linked to the same booking. Boatsetter and GetMyBoat charters are extended on the platform instead.

Photos. The photo box is there from the moment the booking is confirmed, before the trip as well as after; most photos arrive afterwards. It is not shown on a cancelled booking or one not yet confirmed. Anyone with the link can send photos and video, up to 2 GB a file, after ticking the same permission as the share page; the exact words they agreed to are kept with each file. Uploads land with the share page's (6.2), already attached to the booking, and the group can see what has been sent so far.

Our photos of their trip. After the trip the page shows the photos in that charter's `Completed` folder, to view full size and download (6.1). Coral curates that folder, and whatever she puts in it goes up on its own: asked whether each photo should wait for your yes, you said *"Folder is enough."* You can take any photo down in **Marketing → Photo Requests** (5.4), and one you take down never goes back up by itself. When two separate charters share a date, each booking sees only the photos from the folder named after its guest; a glow night's folder names none of its guests, so all of that night's bookings see its photos. Where a shot exists in several crops, guests get one, the fullest frame. Most of the photos are **the best frames from the trip's own video**: people film on a boat far more than they take pictures, so Coral picks the good moments out of the footage (by the kind of trip, and brightened if it was at night) and moves them in. A riding shot, tube or board, is punched in on the rider, about four and a half times, so the guest is the picture and not a speck in the wake; it is softer than the wide frame, which is the trade you asked for. When a charter's own footage is thin she may take frames from your CapCut recap, with the CapCut mark cropped off. The raw recordings and the rest of the extracted frames are never shown. Until a charter has photos up, the page says they are being picked, so a guest knows to look back. A trip page shows up to 50 photos (raised from 40 on 5 October 2026); that is a ceiling, not a target. Every completed charter's guests get at least a handful of good ones, and past that only what is genuinely good. Photos only for now: videos wait for more storage.

Messages. A guest can write to you from the page. You are emailed straight away and answer in **Marketing → Messages** (6.7). Your reply appears on their page and, when the booking has an email address, is emailed to them as well.

Known limit: a booking with no number (an inquiry with no date) has no trip page.

Known limit: which booking sees a photo is decided by name. When a date has more than one completed booking, a photo goes to the bookings whose guest's first or last name is in the charter folder's name (`2026-08-15 Pat Example (...)` → that guest's booking only), and a folder that names none of them goes to all of them, which is right for a glow night. So each private charter's folder must carry its booking's guest name. If it does not, **Marketing** → **Photo Requests** → **On guests' trip pages** warns that two private charters share the photos, and you can take them down there.

Known limit: no videos on the trip page yet. The free storage plan holds 1 GB, and recap videos would fill it within a season.

Known limit: there is no way to withdraw one booking's link. Anyone it was forwarded to keeps it.

Known limit: platform bookings rarely carry an email address, so a reply to one of those guests waits on their page until they look. Text them as well if it matters.

Known limit: the links are signed with the website's session secret unless `TRIP_LINK_SECRET` is set. Changing the session secret withdraws every trip link ever sent, so set `TRIP_LINK_SECRET` first if it ever has to change.

Part 3 — Bookings

Every reservation lives in Bookings → Bookings, whatever it is (an inquiry, a confirmed trip or one that has sailed) and wherever it came from: the website, Boatsetter, GetMyBoat, a text, a phone call or the dock.

3.1 The booking lifecycle

A booking moves through a small set of statuses:

Status	Means	Blocks the date?
inquiry	someone asked; still live	no
lapsed	never turned into a booking. Nothing went wrong.	no
booked	confirmed and holding its date, paid or not	**yes**
owed	they paid, the trip never happened, no new date yet	no
completed	the charter ran	**yes**
cancelled	it was a booking and is off; money may need to go back	no
refunded	it was a booking, and the money has gone back. Nothing is owed either way.	no

Refunded closes what cancelled leaves open. A full refund made in Stripe sets it by itself and emails you; a cash, Zelle or other refund is set by hand. A **partial** refund leaves the status alone and records the amount on the booking. A booking can go straight from booked to refunded.

On a website inquiry the first status reads **new** rather than inquiry; it means the same.

Payment is tracked separately from status, so the Bookings tab shows both together:

Reads	Colour	Means
Booked / paid	green	settled; nothing to collect
Booked / no charge	green	on board at no cost, such as crew riding free. Never counted as a sale.
Booked / unpaid	blue	confirmed and holding the date; the money has not arrived. **This is the chase list.**
Booked / payment failed	red	they tried to pay and the bank refused
Inquiry	grey	asked, not booked

The words carry the meaning and the colour only reinforces them, so the screen reads the same in sunlight, in black and white, or to a colour-blind reader.

3.2 Booking numbers

Every booking gets a number like `NY-20261018-02`:

- the date inside it is the date the charter was **first booked for**;
- the last two digits are the order it was taken for that date, counted across every source.

A booking number never changes. When a charter is rescheduled, the date column moves and the number stays. The number is what the guest quotes, what the ledger points at and what old emails say. A number that moved would stop matching the paperwork.

A number is never given out twice, not even after its booking is deleted. Each day remembers the highest number it has ever issued, so deleting a booking retires its number rather than freeing it, and there can be gaps in a day's sequence. Two limits: a number deleted before October 2026 left no record, and two bookings created at the very same instant could still draw the same number. The second is a known, accepted limit: at this business's volume it is unlikely.

A booking needs a date to get a number. A website booking and its mirror row share one number on purpose.

3.3 The Bookings tab

Add a booking with the form above the table. Each row shows the guest, the date and time, the boat, the **Package** (what decides the price, whether add-ons apply and where to meet), seats, price, status and payment.

On a phone the table drops its middle columns and puts the essentials under the guest's name, for example *Glow night · 2 seats · $100*. A booking at no charge says *no charge*, not $0.

Each row carries the text it needs. These open your phone's messaging app with the message written; they send nothing on their own, and on a computer they say so instead.

Button	Offered when
Text payment link	anyone who owes money and whose row has a package and a price
Text to confirm	a lead with no price yet: asks them to confirm so you can price it
Text reminder	a **paid** booking: the day, departure time, where to meet and their trip page link
Text about the declined card	replaces the payment link while a card decline is on record
Text about owed	a charter that was paid for and never sailed

Every guest text ends by saying a real person is on the other end and they can reply.

trip page ↗ on a row opens the page that guest sees (2.8). Copy it from there to send it by hand.

3.4 Lead source, channel and how they paid

Each booking answers three different questions:

Field	The question	Options
Lead source	Where did they find us?	Website · Text / WhatsApp · Phone · Walk-up · Instagram · Facebook · Repeat guest · Referral · Boatsetter · GetMyBoat · AI search · Other
Booking channel	Who took and processed it?	Boatsetter · GetMyBoat · Website · Direct
How paid	How did the money actually arrive?	Unpaid · Stripe (card) · Cash · Cash App · Zelle · Venmo · PayPal · Boatsetter payout · GetMyBoat payout · Gift certificate

How paid is the one only you can answer. A card payment through Stripe is recorded on its own; everything else has to be set by you, because nothing proves cash changed hands except you saying so. Left blank, the income row says so rather than guessing.

3.5 Taking a booking that came in by text or phone

Most bookings arrive by text, WhatsApp or phone. That is the biggest channel and the easiest to lose track of, so log it the moment it arrives.

1. **Check three things against the live data:** the date is free for that boat, the boat seats the party (see 3.12), and the price matches **Setup → Packages & pricing**.
2. **Log it** as an inquiry, either with the form on **Bookings → Bookings**, or by sending the message to Claude (a screenshot is enough), which logs it with a booking number and drafts your reply.

3. **Reply** to what the guest actually asked, written fresh, not from a template. If they named no occasion, it is the default package.
4. **When they say yes**, set it to **booked** and send **Text payment link**. The row needs a package and a price for the link to work.
5. **When they pay**, the site marks it paid and sends the confirmation on its own (see 2.4). If they pay another way, set **How paid** yourself.

Between "yes" and "paid", a booked row holds the date. An inquiry does not. If a date is in demand and the guest has not committed, block it by hand (see 3.10) and unblock it if they never pay.

From the command line

The same thing in one step, priced the way the website would price it:

```
node scripts/add-booking.js --name "Guest Name" --phone "(555) 555-0100" \
     --package <package id> --date 2026-10-18 --seats 4 --apply
```

- It previews until you add `--apply`.
- `--amount` is a **total** that overrides the package price, for an agreed special rate. It never touches the public prices.
- Without `--vessel`, the boat with the most room that day is chosen.
- It refuses a name or number already booked on that date; add `--force` if it really is a second booking.

3.6 Platform bookings: Boatsetter and GetMyBoat

A platform booking is entered in **Bookings** → **Bookings** with its channel set to the platform and the platform's reference.

GetMyBoat bookings are added for you. Every morning the accounts agent reads GetMyBoat's *Booking Confirmed!* emails and adds any that are not on the books yet: the date, start, length, party, boat and payout come straight from the email, and the boat from which GetMyBoat listing was booked. It only ever adds; it never changes or cancels a booking. Her status names each one. **Boatsetter bookings are still entered by hand.**

Known limit: a booking from a GetMyBoat listing the system does not know yet is reported, not added, until you say which boat it is.

- The platform takes the payment and pays you later: **Boatsetter in legs** (the boat, then the captain fee, sometimes add-ons, days apart), **GetMyBoat in one sum.**
- Boatsetter does not share guest phone numbers or emails: ask the guest on the day and add them, or they can never be asked for a review. **GetMyBoat does**, once the booking is confirmed: they are under **Contact Details** on the trip's page at getmyboat.com (not in the confirmation email). Copy them onto the booking.
- The price on the booking is what you are paid, not what the guest paid the platform.

Booking requests texted in by a trusted helper

Since 4 October 2026 a helper you have authorised (Appendix C) can request a charter by text through your assistant line: guest name and phone, guest count, date, start time, hours, charter type and boat. The assistant checks the details and passes each request to the crew, but never quotes a price or checks the calendar; the helper hears that the price comes with the booking. On her morning run the bookkeeping agent checks everything again (charter type, boat, capacity counting the captain, hours, a clash on the calendar), prices it with the website's own pricing, and answers. **A valid request for a free slot is booked straight away** (your decision, 4 October 2026): it lands in **Bookings** as booked and unpaid, at the website's price, and the helper is texted the booking number and its `/pay/` link, with a one-line note to you. A clash, an invalid request, or anything for today or tomorrow is held instead, with the reason, and goes on the board for you. A booking made this way is a direct booking, so it is paid through its `/pay/` link like any other.

Known limit: answers come once a day, on the morning run, so a request texted at noon is answered the next morning.

3.7 Charging a booking and payment links

Text payment link sends the guest their own page on your website: `thenautiyachti.com/pay/<id>`. It shows the charter and the total, then hands off to Stripe.

- **Never text a raw `checkout.stripe.com` link.** To a careful guest it looks exactly like a scam.
- The page charges the price on the booking, with no coupons. Change the price on the booking first if it needs changing.
- The guest can apply a gift certificate on the page (see 2.3). A code they gave with their inquiry is filled in for them.
- If the booking does not yet hold its day, the page first checks the boat is still free (see 2.7).
- A booking already paid shows **Already paid** instead of charging twice.
- **A test-mode link is never saved against a booking.** A test link takes a card, says thank you and collects nothing. The tools label one **TEST LINK — DO NOT SEND**.

3.8 When the same guest appears twice

Usually a payment link carries the booking's own number, so a guest who pays through it lands on the right row with nothing to untangle. The trouble comes when a guest you logged by hand then books on the website as well: one person, two rows, **and the seat counted twice**.

The morning check names such pairs with its evidence:

Reads	Means
certain	same email, or the same ten-digit phone, on the same day
likely	no contact detail in common, but one name fits inside the other and they bought the same thing on the same day

Nothing merges on its own. Two bookings sharing a phone are just as likely to be two friends booking from one handset, and merging would delete a real seat. To merge a pair you have judged:

```
node scripts/merge-bookings.js NY-20261018-03 NY-20261018-11
```

It shows what it would do and writes nothing until you add `--apply`. The row holding the money survives; the other is filled in from it, then **cancelled, not deleted**, with a note pointing at the survivor. It refuses outright if both rows have money against them: that is either two real bookings or one guest charged twice, and needs a person.

3.9 Owed: paid for, never sailed

When weather, a breakdown or the guest's plans cancel a trip they have paid for, and no new date is agreed yet, set the booking to **owed**. Do not use **cancelled**: cancelled means the relationship is finished and money is going back. Owed means their money is still here and they still want to go.

- An owed booking **does not hold a day**: it has no date.
- It shows as **active**, in amber, because it is work outstanding.
- Pearl reports it every morning until it is settled, urgently if there is no phone or email on file.
- Money stays attached to it in the ledger, and it is **not counted as earned income** until the trip sails.

Reach out from **Overview** → **Guests** → **Charters we owe** (see 5.5). When they pick a date, set it back to **booked**.

3.10 Availability and blocking days

Bookings in Google Calendar. At the top of **Bookings** → **Availability**, open **Bookings in Google Calendar** and copy the private link. In Google Calendar on a computer: **Other calendars** → **+** → **From URL**, paste it, **Add calendar**. Every booking that holds a day appears there (from 30 days back): package, boat, start time and length, party size, the guest's first name, the booking number, how it was booked and whether it is paid. No phone numbers or emails. New bookings, changes and cancellations follow on their own, but Google refreshes a subscribed calendar every few hours, so a booking made a minute ago may not show yet. The console is always current. Keep the link private: anyone with it can see the bookings.

Known limit: the link is built from the console's session secret. If that secret is ever changed, the link changes too: copy the new one and subscribe again.

Bookings → **Availability** shows each boat's days. A day is:

State	When
full	booked charters on that boat add up to 8 hours or more, or you blocked it
partial	booked hours add up to less than 8. The calendar shows the windows taken, such as `10am–2pm`.
open	nothing booked or blocked

Only **booked** and **completed** charters take up time. Inquiries, owed, cancelled and refunded bookings never do. A website booking and its mirror row are counted once.

To block a day, open **Availability** and toggle the day on that boat. Use it for maintenance, private days, and to hold a date for a guest who has said yes but not paid.

A booking with no hours on it counts as none, and one with no start time is not shown as a window. Add both to keep the calendar, and the availability check, honest.

The website enforces this calendar. A guest cannot book or pay for a boat on a blocked day, or for more hours than the day has left. See 2.7.

3.11 Completing a charter

After the trip, set the booking to **completed**. That one action:

1. writes the income row in the ledger, once, with the amount paid, the boat and the hours. Origin comes from **How paid**.
2. updates the website inquiry behind it, if there is one, so the two stay in step.

A completed booking with no price writes nothing. The Overview flags it under **Needs attention**: add the price and the income follows.

Known limit: setting a completed booking back to another status does not remove its income row. If you completed one by mistake, delete the row in **Money** → **Income & expenses** too.

3.12 Capacity counts the captain

A boat's capacity **includes the captain.** A boat listed for 12 carries 11 guests. This is the easiest mistake to make when quoting quickly. Capacities for this fleet are in Appendix C.

3.13 When a payment and the console disagree

A guest says they paid and the booking still says unpaid. Ask Claude to **resync** it; there is no button for this in the console. The resync re-reads Stripe's own record and repairs what is missing: payment, email, phone and

terms acceptance. Then it sends the confirmation if the guest never had one. It only ever copies **from** Stripe, so it cannot mark paid something Stripe does not show as paid.

If confirmations were ever missed in bulk, `node scripts/send-missing-confirmations.js` lists everyone who paid and was never told, and `--apply` sends them.

Part 4 — Money

The ledger in **Money** → **Income & expenses** is the record of every dollar. Folders of statements and receipts are evidence for it; when the two disagree, that is something to investigate, not something to file.

4.1 Income & expenses

Every dollar in or out is one row. The form on the left adds one: **Income** or **Expense**, a category, an amount, a date, and the **origin**, meaning how the money moved. Link a row to a booking and it counts toward that booking's profit.

Below the list are breakdowns by category, profit per booking, and commission lost to the booking platforms.

Two kinds of row write themselves:

Event	Row written
A booking is set to **completed**	its income row, once. Re-saving does not add a second. A completed booking with **no price** gets no row: the system will not invent a number.
Fuel is logged on the phone page with a dollar total	the fuel expense

Everything else is entered by hand, by you or from a statement you have checked.

> **Why it works this way.** Income used to be joined to bookings by hand, and six charters' money went missing that way. A missing row is easy to spot; a made-up number is not, so the system writes rows only from facts it has.

4.2 Origin: how the money moved

Three questions are kept apart, because a guest can find you on Instagram, book through a platform and pay in cash:

Field	The question	Lives on
Lead source	Where did the guest come from?	the booking
How paid	How did the money arrive?	the booking
Origin	How did this particular dollar move?	each ledger row

The origin list and the payment-method list are built from the same source, so neither can gain an option the other lacks. Card payments file as **Stripe**; a platform payout files under the platform; cash as **Cash**; Cash App,

Zelle, Venmo and PayPal each as their own statement.

- **Cash App is not Cash.** One leaves a statement and can charge a fee; the other does neither.
- **One charter can be paid two ways.** The booking holds the main method, and each actual payment is its own ledger row.
- **One thing spelled two ways is two things.** Use the spelling already in the list. The morning check reports an origin spelled more than one way, and an origin the console cannot display.

4.3 Reconciliation

Money → Reconciliation answers one question per booking: is this charter's money on the books? It matches on the real link between a booking and its ledger rows, never on date and amount.

Boatsetter pays in legs (the boat, then the captain fee, sometimes add-ons), often days apart. Several income rows on one charter is normal there. GetMyBoat pays in one sum.

When a charter's money cannot be found

The Overview may say "*N income rows are not tied to a charter.*" Find out which of two things it is before doing anything:

- **Unlinked:** the money is in the ledger but not joined to its booking. **Link it. Do not add a row.**
- **Missing:** nothing in the ledger matches at all. Find out what happened, then add one.

Adding a row for money that was already recorded **counts it twice on your tax report.** Some unlinked income is correct and always will be, for example ticket income from an event with no single booking behind it.

4.4 Tax Report

1. Open **Money → Tax Report** and pick the year.
2. Choose **Show**: income and expenses, income only, or expenses only. The choice applies to the screen **and** to both downloads.
3. **Download PDF** for a printable summary (totals, breakdowns, every entry), or **Download CSV** for a spreadsheet.

Net profit appears only when both sides are showing, so one side alone is never read as profit.

What the report does for you:

- **Money held for a trip that never ran is not income.** It is a deposit until the trip sails. The report shows the excluded amount in an amber note so it still reconciles with the bank.
- **Income is split by vessel and by origin**, because every charter is filed under the one category *Reservation*.

- **Average per charter and per hour** come from bookings, not ledger rows, so a platform charter paid in two legs is not counted as two trips.
- **The subscriptions figure is business only.** Personal subscriptions are left out, and the PDF says so.
- An amber note flags income with no vessel recorded. Fill those in.

4.5 The bank balance

The ledger answers *did we make money*. The bank balance answers *will this week's bills clear*. They are different questions, and a season can be profitable while the account is overdrawn.

The balance on the Overview is **a reading, not a live feed.** Someone reads the bank app and records the figure with its date. The age shows beside it and turns amber after a week. The figure is green, amber under $250, red when negative.

Readings are never edited. A wrong figure is corrected by recording a newer one, so the history keeps the bad month as well as the good one. Readings are recorded by an agent or a script with the date they were taken; the console shows them and does not take input.

4.6 Gift certificates

Money → Gift certificates lists every certificate bought on the website: code, buyer, face value, what is left and its state.

When one is bought, the buyer is emailed the certificate, and so is the person it is for when the buyer gives their email. You get one notice: the code, the value, and who it reached. The sale is income on the day it is bought.

A certificate that is paid for and not yet used is a **liability**: the money is in the bank and the trip is still owed. Read it like a charter that was paid for and never sailed.

- **Guests redeem one themselves**, on the booking form or on a payment page (2.3). You can still redeem one by hand here against a booking. A partial use leaves the rest on the certificate.
- **A certificate refunded in full in Stripe is voided by itself.** Its sale stays in the ledger as income until you correct that row.
- **Certificates never expire on their own.** Voiding an old one is a decision to make on purpose.

4.7 Subscriptions & bills

Every recurring cost, turned into a monthly figure so weekly, monthly and yearly bills can be added up. It includes the household bills that are partly business costs when the office is at home.

The four columns that matter

Column	Meaning	Note
Where	which address or account it belongs to	Two live accounts with the same supplier usually means an old one was never closed, and the tab says so.
Amount	the cost	**Blank is not zero.** Blank means nobody has checked; `0` means confirmed free. Blank amounts are listed as open questions and add nothing to totals.
Business %	the business's share	**Blank means not decided**, and the bill stays out of the deductible total until it is.
Ended	the date the account closed	Setting it closes the account; *Active* follows on its own.

The two totals

The first total is what leaves the bank each month. The second is **the business's share**, the only figure that belongs on a tax return. Write the basis for each percentage into the bill's note (for example, the office's share of the home's floor area), because an accountant will ask for it.

Personal subscriptions

Personal subscriptions can be kept here so duplicates and waste show up across everything you pay for. They are **kept apart from the business entirely**: their own line, their own total, and never included in the business figures or the tax export. The **Side** button moves a bill between business and personal.

Groups, the calendar and phones

Bills are grouped by category (Utilities, Storage, Software, Hosting, Other, then Personal). Groups start closed; each heading shows its count, monthly total, business share, and how many bills are unpriced or closed. Inside a group the largest bill sorts first.

The **calendar** draws the month with each bill on its due day, but only bills whose due date came from a real receipt. The others are named underneath, so an empty day means nothing is due. Yearly bills appear only in their own month.

On a phone, each bill becomes a card and the calendar scrolls inside its own box.

Part 5 — Guests

5.1 Contacts

Bookings → **Contacts** lists people, not trips, so a repeat guest appears once however many times they have sailed. Three lists, each collapsed until opened:

List	Who is on it
Everyone we can contact	every guest and enquirer with a phone or an email. The count is of people you can actually reach.
Extra guest contacts	people who sailed on someone else's booking and whose number was kept
Crew list	people who signed up for event news on the website or from the on-boat QR code

The two lower lists are **subsets of the top one**, not additions to it, and their headings say so ("*2 of the 30 above*"). Do not add the three counts together.

Trips count charters, not rows. A website booking leaves two records behind it, and a guest whose number appears on one booking but not another is merged into one person with both trips.

Copy mailable emails sits on the crew-list header, for mailing everyone when an event date is set. To honour an unsubscribe, set that person's status to lapsed.

Texting someone from the list

Every reachable contact has a button that opens a text to them, with the number and a message already filled in. **It sends nothing:** it opens your phone's own messaging app, and you read it, change it if you like, and press send. On a computer it says so instead of pretending.

- **It reads the offer that is live right now.** While a sale runs, the button carries its code and the message names the discount, the limit and the end date. When the code expires or runs out, the button stops offering it on its own. With no sale, it is a plain catch-up message.
- **It only offers a code with both an end date and a usage limit.** Codes kept for particular people never go to the whole list.
- **Two openers:** someone who has sailed hears "*hope you've been well since your trip*"; someone who only asked hears "*you asked about a charter a while back.*"
- **Anyone who opted out has no button at all.**

5.2 Asking for reviews

Google reviews are the business's best advertising, and the time to ask is within a few days of the trip. There are two places to ask from:

- **On the dock** → **Reviews** on your phone: the quickest way, with guests sorted warmest first. See 8.4.
- **Marketing** → **Testimonials**, on any screen: the full list with filters.

On Testimonials, four filters: **Still to ask**, **Already asked**, **Not asking**, **Every charter**.

Button	What it does
Text it	opens your messaging app with the message written, and ticks the guest off. Phone only.
Preview	shows the wording, and can copy it for pasting into a platform's message thread
Don't ask	takes the guest off the list for good. They move to **Not asking** and can be restored with **Put back**. Nothing is deleted.

Ask via appears only for guests with no phone number: a platform message thread is then the only way to reach them. Rows marked **extra contact** are people from someone else's booking, and can be asked like anyone else.

> **Why it works this way.** The booking platforms do not hand over guest contact details, so every number was entered by hand. A guest with no number is a review that can never be asked for. **Don't ask** exists so a guest you will never ask does not have to be falsely marked as asked.

5.3 Testimonials

Marketing → **Testimonials** also holds the reviews shown on the public website. New ones wait for your approval and the tab's number counts those waiting. Approved reviews carry no number, because nothing about them needs a decision.

5.4 Photo Requests

Marketing → **Photo Requests** lists guests who asked for their photos (from the QR code on the boat) and have not been sent them. The number counts what is still owed. When nothing is owed it shrinks to one line, since trip pages now give guests their photos; the full list comes back the moment someone asks.

- **Longest wait first**, on purpose: the guest at the top is the one most likely to have given up.
- The button opens a message with the greeting written. **Paste the album link yourself**: the files are on your computer, not in the database.
- Marking it sent clears it from the queue.

Underneath, **On guests' trip pages** shows **our** photos that are up on each booking's trip page: every photo in a charter's `Completed` folder, put up by Coral's sync each run. Each charter shows whose page its photos are on, with a warning when two private charters share a date. Tick any you would rather a guest did not have and **Take down**; it stays down.

Below that, **Photos guests sent us** shows the photos and video guests have uploaded to you (6.2). Once Coral has approved one into its charter's `Completed\_guest media`, its card says **on the trip page**, names the charter folder, and previews the trip-page copy.

5.5 Charters we owe

A guest who paid for a trip that never happened, through weather, a breakdown or their own plans changing, is **owed** a charter. They appear on **Overview** → **Guests** → **Charters we owe** until it is settled, with what you are holding and for how long.

Button	What it does
Text it	opens your messaging app with the message written. Phone only; with no number on file it says the guest cannot be reached at all.
Preview / Hide	shows the exact wording, with **Copy wording**
Email	appears only when there is an email on file

The wording cannot be edited, on purpose. **Offer a weekend, not a refund:** none of the messages mention money back or apologise at length, because leading with a refund invites the answer that ends the relationship. If they want their money back they will ask. When they pick a date, set the booking back to **booked**.

The panel is not shown at all when nobody is owed, which is the normal state.

Part 6 — Photos, video and social media

6.1 The photo library

All charter photos and video live in the photo library. Since 13 October 2026 the library is on **an external drive**, not in Google Drive: the raw footage of one charter runs to several gigabytes, and it filled both Drive and the PC. Drive keeps **finished work only**: each charter's `Completed` folder, any partner copy, `_Compilations`, `01 Fleet` and the tag file, copied there by Coral at the end of every run. `00 Inbox` stays in Drive, because that is where the phone uploads, and the library on the external drive points to it. If the external drive is unplugged, Coral's media tools stop rather than write raw footage back into Drive. The library is large, and organised so the crew can find things without anyone browsing it. **It holds only media for social posts and the website** (your rule, 3 October 2026): `00 Inbox`, `01 Fleet` and `02 Charters`. Apparel, campaign graphics and QR codes live in `04 Brand & Pricing`, equipment photos in `03 Fleet & Equipment`.

Folder	What goes there
`00 Inbox`	where new footage lands from the phone and the camera glasses. The content agent files it every run. Its `Imported from Website` folder is where what guests sent through the site lands: the only copy, never deleted. Coral files each into its charter's folder by the booking number it came with; anything she cannot place waits there for you (6.2).
`01 Fleet`	one folder per boat (and `Retired Vessels`, `_Maintenance and helm`): the boats themselves, for listings and the website.
`02 Charters\_By charter`	one folder per charter, named `YYYY-MM-DD Guest Name (tags)`, the tags being its themes and place, e.g. `2026-06-20 Pat Example (tubing, the dam)`. Tags are the themes posted on the website (the Island, the Dam, Party Cove, a birthday, a bachelor or bachelorette, tubing, wakeboarding, a swim stop, glow, night cruise, corporate; also photo shoot and jetski rentals where those were the booking), never the dock or cruising shots almost every charter has; `()` means no themes on purpose, `(tags needed)` that nobody has said yet. Every charter folder holds `_from video`, `Completed` and `Completed\_guest media`. **This is the main library, and the only home of charter media.**
`Completed\_guest media`	inside every charter's `Completed`: the photos and clips guests sent that Coral approved. Shown on that charter's trip page with the rest of Completed.
`02 Charters\_Compilations`	finished videos cut from many charters (the theme compilations). Never raw media.
`02 Charters\_outings`	your own outings and days with media but no booking (friends, promo nights), each in a dated, tagged folder such as `2026-06-27 Outing (party cove)`; undated strays in `_undated`. Every outing folder holds `_from video` and `Completed`. Called `06 General and Atmosphere` until 3 October 2026. **The crew may draft posts from it**, never captioned as a charter, and you approve or turn down each one as usual.
`_not for use`	inside a charter or outing: a clip you called bad in a review note, moved there by Coral and kept. Nothing is ever taken from it. Media that can never be used (nudity, nothing to do with the boat) is not kept like this: you delete it.
`_from video`	every usable frame pulled from a charter's video: the pile Coral picks the best photos from. The pile itself is never shown or posted as a whole
(no `_originals`)	since 3 October 2026 the uncropped original of a cropped file sits in the trip folder itself, with the raw footage; the cropped one is in `Completed`. Never post both.
`Completed`	**the charter's finished set**: the good photos, the good videos and that charter's own montage. (Compilations across many charters live in `_Compilations`.) Called `compilation video` until 2 Oct 2026. Its photos are what that charter's guests see on their trip page, and it is the first place the crew looks for a post. Coral curates it: mostly the best frames from the charter's video, plus any good photos actually taken. Raw recordings, soft or duplicate frames, and shots that are not about the guests (a dashboard, an empty wake) never go in. Frames from a CapCut recap may, when the

Folder	What goes there
	footage is thin, with the mark cropped off. The montages Coral cuts land here, and mix in up to six of its good photos with a slow push-in and the same transitions as the clips.
`_Unsorted`	your sorting pile: footage the crew cannot tell is the business's, or cannot place in a charter or a dated day. **Never a source for anything published.** You go through it and clear it yourself.

Filenames carry what a folder cannot. A file keeps its name when it moves, and loses its folder. So a finished cut carries its date, its subject, its shape and, where known, its place:

```
2025-07-20_tubing_wakeboarder-golden-hour_9x16.mp4
```

Suffix	Shape	Used for
`_9x16`	upright	Reels, TikTok, Stories
`_4x5`	tall rectangle	Facebook and Instagram feed
`_1x1`	square	feeds
`_16x9`	landscape	the website, YouTube

Finding a photo

Do not browse the folders. Ask the index. Every photo is tagged with its package, place and activity, and a search returns matches with anything blocked already removed:

```
node "<Crew\_Scripts>\find-media.js" --activity tubing --clean
node "<Crew\_Scripts>\find-media.js" --package birthday
node "<Crew\_Scripts>\find-media.js" --location party-cove
node "<Crew\_Scripts>\find-media.js" --vocab        (every tag that exists)
node "<Crew\_Scripts>\find-media.js" --coverage     (which themes are thin)
```

Tags live in `Photos\_media-tags.json`. Tag a charter folder and every file in it inherits the tags. A file is never copied into a second folder to file it twice.

Media that must not be used

These are never posted, and the index and the publishing checks enforce them:

- anything on the `doNotUse` list in the tags file. Some entries block a whole file; others (`timeRestricted`) block only certain seconds of it.
- anything in a folder whose name contains `[NDA]`
- a boat the business does not own presented as one a guest can book
- anything in a `_not for use` / `Not used` folder, or in `_Unsorted`

- **a file that has disappeared from the library.** You delete what is not good enough, so a missing file was deleted on purpose (your words: *"If they are missing, it's because I deleted them because they weren't good."*). The crew never brings one back, and the publisher holds a post built from one and sends it back to the content agent for a better shot.

Everything else is a candidate. A watermark from the editing app, another company's boat in the background, a recognisable stranger: none of these is a reason to reject a picture. The crew has been far more often wrong in rejecting good material than in letting bad material through.

Screen night footage at full size. At thumbnail size a problem in a dark clip cannot be seen. Look at the frame that will be used at full resolution before it ships.

6.2 Photos guests send you

Guests send their own photos and video two ways:

- `/share-your-photos`, open to anyone, for a party member with no link of their own. It is no longer in the menu, and it tells booked guests to use Guest Login. They give their name and phone, pick their trip from a list of recent dates (packages only, never guest names), tick that you may use them, and upload. The booking is matched by phone number, which is a hint, not proof.
- **Their trip page** (2.8), through **Guest Login**, any time once the booking is confirmed. There is no phone to give and no list to pick from, because the link already says which booking it is. The exact consent wording is stored with each file.

Both take up to 2 GB a file into private cloud storage. Nothing is ever posted from there.

Marketing → Photo Requests → Photos guests sent us shows the latest 200: a preview, who sent it, the booking or trip, when consent was given, and whether it has reached the PC yet. Previews are links that stop working after an hour; the storage itself is never public. **Throw out** stops a file being pulled to the PC. The record stays, and **put it back** undoes it.

Coral pulls them on each of her runs (8:30am and 2:30pm), with `pull-guest-uploads.js` on the office computer, into `Photos\00 Inbox\Imported from Website`, then **removes each one from cloud storage**. That folder is named so that anyone can see the files came from guests and that there is no other copy. Inside it there is one folder per charter, named after the booking when it is known: `2026-09-19 Pat Example - NY-20260919-03` came from that booking's trip page and is certain; `… - phone matches NY-…` came from the share page, where the booking is a guess from the sender's phone; `_no charter given` waits for you. Who sent each file is in its name (`guest_tyler_…`), and is often not the person who booked. Coral's filing step then moves each folder's files into that charter's folder (the charter is decided by the booking the upload came through, never by the date stored in the photo, which can be wrong; a share-page guess that disagrees with the charter the guest picked waits for you), never deleting one, and the good ones go on into that charter's `Completed\_guest media` folder, which puts them on the guests' trip page and makes them available for posts. From then on the copy on the computer, and Drive behind it, is the only one. A file is removed only once the copy on disk has been measured and matches what storage held; anything that does not match stays in

storage and the script says why. `--keep` leaves everything in storage. Using one in a post or on the website goes through the photo library and post approval like any other photo.

> **Why it works this way.** The free storage plan holds 1 GB across the whole account, and one glow night of guest video came to 2.4 GB. Left in storage, a single busy night would put the account over its limit, and the provider may then restrict the project. Your choice on 2 October 2026, over paying for a bigger plan, "for now at least".

Once a file has been pulled, the console and the guest's trip page show it as received but no longer preview it, until Coral approves it into its charter's `Completed\_guest media`: then the console card says **on the trip page**, names the charter folder and previews the trip-page copy.

Known limit: no email arrives when a guest uploads. Look at the panel, or run the pull script.

Known limit: share-page uploads record when consent was given, not the words agreed to.

Known limit: a file you throw out is never pulled, so it is never removed from storage either, and it keeps counting against the 1 GB.

6.3 The public gallery

Marketing → **Media** manages the photo gallery on the website, grouped by package. Grouping shows at a glance which package is thin.

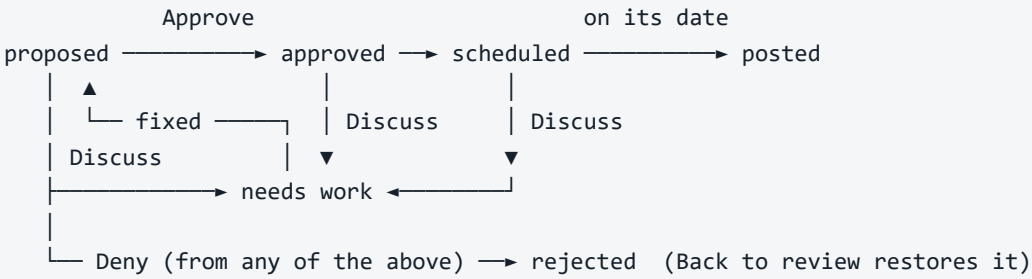

- Captions edit in place. **+ Add** adds a tile to that group.
- New images belong in the site's own `public/gallery/` folder, referenced as `/gallery/name.jpg`. Images hosted elsewhere disappear if that account ever lapses.
- Deleting a tile removes it from the site, not the image file.

6.4 Social posts: from draft to published

The content agent drafts posts from real fleet media; you approve them; the publishing agent puts them out. Every post is a card in **Marketing** → **Media Drafts**, in five sections:

Section	What is in it	Who acts
Already posted (collapsed)	Posts that went out, newest first	Nobody; it is the record
Denied (collapsed)	Posts you denied	Nobody; **Back to review** restores one
Proposed — needs you	New drafts, and drafts sent back for a fix (*needs work*)	**You**: approve, discuss or deny
Scheduled	Approved, dated and checked, boxed by the day they go out, soonest first	Nobody; they post on their own at the time shown
To be scheduled	Approved but not yet given a slot, and any approved post whose date passed without it going out	The crew gives each a date and time on its next run

A post that missed its date is not dead. It moves to **To be scheduled** for a new slot rather than disappearing.

A post sent back with **Discuss** returns to you as *proposed* once it is fixed, and you approve it again (you can also approve it straight from *Needs work*).

State	Means
Proposed	drafted by the crew, waiting for you
Needs work	you sent it back with a reason; the crew will fix it
Approved	you said yes
Scheduled	approved and dated: **it will publish on its own**
Posted	live, with its link recorded
Rejected	you said no. Nothing is deleted.

What publishes on its own

A post marked scheduled publishes on its own when its date and time come. The publishing agent runs twice a day, late morning and evening, and puts out whatever is due by then. Giving a draft a date **is** the

permission to post it: there is no second confirmation.

- **Approved with a date** is the same permission. The publisher moves those onto the schedule herself at the start of each run.
- **Approved with no date never goes out.** The content agent gives each of these a date every morning and says which dates she chose, so you can move one with **Reschedule**.
- **A completed charter's recap goes out first.** Every completed charter gets one trip video, its recap, 40 to 59 seconds when the footage allows, finished in the run after its footage is filed, and drafted for you as *the newest trip*. Once you approve it, it takes the soonest slot: tonight's evening post if it is before 6:30pm and tonight is free, otherwise tomorrow. If that day already has a post, everything scheduled from that day on moves back one day, in order, and the agent says what moved. No other post jumps the queue.
- Nothing else is ever published: not a proposed draft, not one that needs work, not a rejected one.

So the queue is safe to leave alone until a post's date arrives. **To stop a post for good, press Deny.** To hold it for a fix instead, press **Discuss**: a post needing work never publishes until you approve it again.

On a card

- The photo or clip, or **No media attached** with a link to add one. A scheduled post with no media fails on the day.
- The caption in full, so you approve the words against the picture.
- The platform and the time.
- **Approve**, **Discuss** and **Deny** while it waits for you; **Discuss**, **Reschedule**, **Deny** and **Copy caption** once it is approved or scheduled.

Posted, rejected and past drafts sit in a collapsed group, as a record.

The three review buttons

- **Approve**: the post goes ahead as it is. It is dated (by you, or by the content agent next morning) and publishes on its own.
- **Discuss**: you want the post, but something in it needs fixing. Pick what, add a note if you like, and press **Send back to Coral to fix**. It moves to *Needs work*; she fixes it and it comes back to you to approve. Discuss stays on the card after scheduling too, which is when "not that clip" tends to get noticed.
- **Deny**: the whole post is off. Pick why and press **Deny the whole post**. It moves to *Rejected* and never goes out. Nothing is deleted: **Back to review** on a rejected card brings it back.

Under	Reason	Means
Discuss	**Wrong photo or clip**	the media does not match the post
Discuss	**Find a better one**	right footage, weak shot
Discuss	**Caption needs work**	wording, tone, hashtags or a wrong detail
Discuss	**Audio problem**	no sound, too loud or quiet, a song that could be flagged, or language that should not be heard
Discuss	**Wrong day or time**	right post, wrong slot
Deny	**Too similar to another post**	repeats something already queued
Deny	**Guest or privacy problem**	someone in it should not be, or it names the wrong guest
Deny	**Not right for us**	wrong message for the business
both	**Something else**	say what in the note

Under Discuss, both photo-or-clip reasons also offer **Swap the media now**. For an audio problem Coral checks the sound, then re-exports the clip with its own audio, makes the post a Story (borderline audio goes to Stories), or uses a different clip.

> **Why it works this way.** The reasons are a fixed list so they can be counted. "Six of the last ten were rejected for the wrong clip" changes what the content agent does next week; ten free-text notes saying roughly that do not. Until 3 October 2026 both buttons opened the same list with both outcomes; you asked for Discuss to mean "fix it" and Deny to mean "deny the whole post together", and for an audio option.

There is no **I posted it myself** button any more (removed 3 October 2026): posting is automated, and the publisher marks her own posts and records their links.

Every card records where its media came from: which charter folder, which file, which second.

Trip recaps made in CapCut

After each completed charter, once its `Completed` folder is curated, the content agent builds a **recap as a project in your CapCut desktop library**, named after the charter, such as "2026-06-20 Pat Example recap (Claude)", then **exports it, finishes it and files it in the charter's `Completed` folder** herself. Since 5 October 2026 you export nothing ("*all this media editing you are doing should be applied to corals job*"). The recap then goes through the queue like any other video, and the project stays in CapCut if you ever want to change it.

- **Shots** are the charter's own vetted photos, found in their clips and held only while the camera stays on that scene.

- **Music** comes only from your Music shelf: a CapCut project called *media shelf* holding tracks you added from **Commercial only**. The agent picks one that fits the trip (from the charter's tags), never the same song twice running, and cuts every shot on its beat. Add tracks to the shelf whenever it feels stale.
- **Exporting** uses CapCut's own Export button, which the agent works the way you would, so the music stays licensed through CapCut. It does this only when CapCut is closed, the PC is unlocked and nobody has touched it for two minutes; otherwise it waits for the next run. Before it takes the mouse it shows a **30-second countdown** on screen with a **Not now** button (press it and the export waits for the next run), and while it works a banner says hands off. It closes CapCut's promotion pop-ups, never uses "Share", and closes CapCut afterwards.
- **Black bars:** most footage is 4:3, so in a 9:16 video it sits between bars. They are filled with a blurred copy of the same picture (your choice, 5 October 2026), which keeps everyone in the frame.
- **Riders are zoomed in.** A tubing or wakeboarding shot is punched in about four times and centred on the rider (your words: "*when wakeboarding or tubing we need a zoom on them*"), kept short so the rider stays in frame, and the riding shots lead the recap. A wake-surfer is the exception: they ride close behind the boat and already fill the frame, so a clip Coral has tagged as wake surfing is punched in about three times instead (your words: "*if wakesurfing then we need not to zoom in 4x, just lessen it slightly*"). Every other shot shows the whole picture. Coral finds the riders by following the tow rope to whatever is on the end of it, in every clip, and each rider becomes a zoomed photo on the guest's trip page too. On a trip that towed, riders may fill up to half the recap; a wide shot of an active tow with no rider zoom yet is flagged so Coral makes one.
- **Length and order:** one recap per charter, 40 to 59 seconds when the footage allows. Your own phone media (Snapchat saves) goes in first, then the riders, then the best camera-glasses moments. A day that was nearly all riding can come out shorter.
- **A moment you must have** (a group jump, a cake) can be tagged *must* in the tag file: it is never trimmed, it is held mostly after its frame, and it is never the last shot, because the end card covers that one.
- **Colour:** the camera glasses record HDR. Every shot is converted to ordinary colour before CapCut sees it, so greens stay green. A recap that came out washed out can be rebuilt with the same song and shots, colour fixed.
- **Shared charters:** a charter run on a partner's boat gets a second copy of the recap for the partner, in a `For <partner>` folder beside `Completed`, and its posts credit the partner.

Known limit: a rider is only zoomed in if Coral has made a rider photo from that clip. Older tubing charters are being caught up a few per run.

Theme compilations made in CapCut

Straight after a recap, the content agent keeps **one compilation per theme** current in your CapCut library: tubing and wakeboarding, Party Cove, the Dam, the Island, swim stop, birthday, bachelor and bachelorette, Boatz & Glowz, night cruise, corporate. Each is cut from every folder whose tags name that theme (your words: "*a Party Cove collaboration of all charters we've had that have gone to Party Cove, pulling the best moments of each one of them*"), charters first, each charter before any gets a second shot, then your outings. A riding shot never goes in a place cut, because tubing happens out on open water, not in the cove; the night

and glow cuts take only footage shot after 7:30pm. A theme is rebuilt only when the shots it would use change (a newly tagged charter, usually; an outing whose photos only fill thin themes, usually not), under a new dated name (a second the same day is "v2") ("Party Cove compilation 2026-10-03 (Claude)"), so one you have edited is never overwritten. The agent exports and finishes each one into `Photos\02 Charters\_Compilations` the same way as a recap, and drafts posts from there, through the queue as usual.

One fresh compilation every morning. Besides those rebuilds, the content agent's morning run makes one new compilation a day, its theme drawn at random with tubing and wakeboarding three times as likely as any other, because that is the main seller (your words: "*They should be created at random with a little more focus on tubing/wakeboarding*"). Each one shuffles which shots and trips it uses and takes a different song, so the same theme made twice is two different videos. It skips the day if a week of unposted compilations is already waiting.

Known limit: a theme with fewer than four usable shots is not built. On 3 October 2026 that was night cruise (three usable night shots) and corporate (nothing tagged yet).

Known limit: CapCut has no official way in, so the projects are written in CapCut's own file format. A CapCut update could change that format and stop new recaps being built until the tools are updated; recaps already in your library are not affected.

Known limit: a 720p clip zoomed onto a rider is noticeably softer than the rest. That is the trade for seeing the rider at all.

6.5 What each platform will take

	Photo	Video	Story
Facebook	yes	yes, as a Reel	yes, for upright (9:16) video only
Instagram	yes, feed only	yes	yes, for video
TikTok	**no**	yes	has no Stories

- **Every post goes to the feed and to the Story** on each platform that has one, automatically. A photo gets no Story leg. If a Facebook Story refuses a video that is not upright, the feed post still goes out, though the publisher's email can make it sound as if the whole post failed.
- **Five hashtags, never six.** More than five makes Instagram reject the post outright while the draft still looks scheduled. The limit applies to every platform.
- **A published post cannot be edited from here.** Fix it in each app by hand; TikTok cannot be edited at all.
- **Borderline audio or language goes to a Story**, which disappears, not to the permanent feed.

6.6 Comments

Marketing → **Comments** is the queue of Facebook and Instagram comments nobody has answered, in two lists: **Waiting** (what still needs you) and **Answered**.

Colour	Waiting
fresh	under 6 hours
waiting	over 6 hours
overdue	over 24 hours

Nothing here posts on its own. The crew writes a suggested reply into the box; you send it, edit it, or write your own. A comment reply is public, immediate and attributed to the business, so a person sends it.

- **Each comment shows the post it is on**, with a link. A comment on a post you put up by hand reads **post not identified**.
- **I answered this elsewhere**, beside **Post reply**, moves a comment you answered in the Facebook or Instagram app (which this screen cannot see) into **Answered** and out of the count. **Put it back** undoes it, and if they write again it comes back to Waiting by itself. The crew stops drafting for it too.
- **Every reply leaves a record**: what was said, under which post, and whether the suggested wording was changed.
- **TikTok comments are not here**: the publishing service cannot read them. Check them in the TikTok app.

A classifier is being built to decide which comments a machine could safely answer. **It sends nothing**, and will not until it has been run in a watch-only mode and you approve it.

6.7 Messages

Marketing → **Messages** is the direct-message inbox from Facebook and Instagram, built the same way as Comments, with the same **Waiting** and **Answered** lists (Trip page messages sit above them).

Messages answer themselves; comments do not

Most messages get an automatic reply within seconds, from an automation in the publishing service, not from any crew member. It is a fixed message that asks for a phone number and points to the website. It never quotes a price, a date or a seat count. It fires on keywords such as book, price, available, seat, open, the days of the week, and "how much".

> **Why it works this way.** A comment speaks to everyone reading the thread, so caution matters most there. A message speaks to one person and can be corrected in the next sentence, so speed matters most there.

Keyword matching is blind. "Your prices are a scam and I want a refund" contains *price*. So every thread is checked afterwards, and one the machine should not have answered is flagged in red: **Answered automatically, and should not have been**. Read what went out before replying.

These are always held for you, and the reason shows on the card:

Held because	Meaning
safety	someone may have been hurt, or something damaged
legal	lawyers, insurance, liability, a refund or a chargeback
complaint	it reads as a grievance
money already moved	it asks to change, refund or move something paid for
solicitation	a sales pitch, not a guest
NDA	it touches a charter under a confidentiality agreement
photographs	someone's picture, or a request to take one down

Long messages, ones asking more than two questions, and ones nothing in the system can answer are held too. **An unrecognised message is not a safe message.**

The crew drafts a reply for each held thread; you send it or write over it. If the guest writes again first, the draft is marked stale and not pre-filled. **I answered this elsewhere** works here as on Comments: the thread moves to **Answered**, the crew stops drafting for it, and it re-opens on its own if they write again. It has no effect on the automatic reply, which can only be switched off in the publishing service.

Trip page messages

Trip page messages sit at the top of the tab: booked guests writing from their own trip page (2.8). They count toward the tab's number, and you are emailed when one arrives.

- **A draft is waiting when the booking itself has the answer**: the departure time, the meeting point, what is included and what to bring. The site writes it from the booking and shows it as Pearl's. It quotes nothing the guest's own page does not already say.
- **Everything the message rules above hold is held here too**, and so is any question about price or another date, because on a booked trip those change the booking or the bill. The reason shows on the card.
- **Nothing is sent until you press Send** and confirm. The card says whether the guest will get an email copy.
- **Handled elsewhere** clears a message you answered by phone or text. It sends nothing, and the thread comes back if they write again.

Siren drafts for the held ones on each run, so a held trip page message usually has her draft by the next morning or evening. Hers replaces the site's for that thread. Like every draft, it waits for you to send it.

Part 7 — The AI crew

7.1 Who they are and when they run

Eight agents and two routines run on a schedule on the office computer. **None of them post, spend or contact a guest without you**, and only one acts outside the business at all.

When	Who	What she does
Daily, 8am	**Nauti Penny** · Accounts Receivable	money in: payouts against the ledger, and money held for trips that never ran. Adds new GetMyBoat bookings from their confirmation email (3.6). Keeps the business inbox in order.
Daily, 8:30am and 2:30pm	**Nauti Coral** · Content Producer	pulls what guests sent from the website, files new footage, curates each charter's `Completed` folder (which the guests see), makes each new charter's recap and keeps the theme compilations current in CapCut, exporting and finishing them herself, plus one fresh compilation each morning (tubing weighted) (6.4), drafts posts from real fleet media, audits the post queue, dates approved posts. The afternoon pass fixes any post that failed to publish, for the publisher to put out on her next run.
Fri–Mon, 9am	**Nauti Joy** · Guest Relations	who to ask for a review, new crew-list signups, guests owed a charter
Fri–Mon, 9:30am	**Nauti Reef** · Revenue Growth	money the business is not collecting, as one to four ideas
Fri–Mon, 10am	**Nauti Shelly** · Accounts Payable	what is paid for against what is used
Daily, 10:30am	**Nauti Nova** · Market Research	the outside world: rules, grants, platforms. Reports only on Mondays, and usually reports nothing.
Daily, 10:45am	Crew Standup (routine)	files a status card for all eight, so no card is blank
Daily, 11am and 8pm	**Nauti Pearl** · Chief of Staff	reads everything, keeps the board, decides what reaches you. The 8pm run is a short evening check.
Daily, 11:15am and 7:15pm	**Nauti Siren** · Publishing & Brand Safety	the last check before anything is public, then publishes what is due. Drafts replies to comments, held messages and held trip page messages.
Hourly, 8am–9pm	Comment Watch (routine)	drafts replies to new comments

Times are when each run is scheduled; a run can start up to about a quarter of an hour later. The office computer must be on for them to run.

7.2 What none of them may do

- Write anywhere their own job in 7.1 does not name. Every agent writes the to-do board and its activity log; beyond that, only the named jobs: the bookkeeping agent adds platform bookings, the content agent drafts and dates posts and keeps trip-page photos matching `Completed`, the publisher records what she published, and an agent records bank readings. No agent edits a booking's details, a price or a guest's record.
- Contact a guest. (The automatic message reply in 6.7 is a feature of the publishing service, not a crew member.)
- Spend, refund or change a price.
- Publish anything, except Siren publishing posts **you** have approved and dated.

7.3 The Board

Overview → The Board (To-do List) is the shared workspace between you and the crew. They write to it, read each other's items, and hand work over by naming another agent in an item.

- Type into **Add a task…** and press **+** to add your own.
- Items are ranked **High / Medium / Low**, not by date. Crew items carry their own priority; yours are ranked by what they say. Money held, security, legal and overdue go High, and anything due within two days is promoted. High starts open; Medium and Low fold open when clicked.
- **Long items fold**: the claim and its first two lines show, with *+ N more lines* and *N notes* for the rest.
- Tick an item to mark it done. ✕ deletes it, after a confirmation, and cannot be undone. Done items fold into **N done**.
- Every crew item is **signed**, for example `[PENNY · T2]`. An unsigned item means you wrote it. **T1** is urgent, **T2** worth your attention, **T3** background.
- **Pearl keeps the board**: she closes what the data shows is done, folds duplicates together, and tidies stale low items. She never closes an item you wrote unless it is genuinely finished.

7.4 Status cards and voices

Each agent has a card with her latest status, filed every morning **even on days she does not run**. A card showing a date instead of today means she has not filed today.

Click an agent's face to hear her read it in her own voice. Clicking again stops her; clicking another agent stops the first. Nothing in the console ever speaks on its own. Each click costs a little, because speech is billed per character; replaying the same status is free.

	Voice	How she writes
Pearl	Alice	dry and unhurried; tells you what you would rather not hear
Coral	Jessica	keen, and hardest on her own work
Siren	Charlotte	flat and literal on purpose: she is the gate
Joy	Lily	warm, a little wounded on the guests' behalf
Penny	Matilda	charming and teasing, proprietary about the books
Reef	Laura	the enthusiast, selling you an idea
Shelly	Sarah	dry and sceptical about what you pay for
Nova	River	sparse; speaks rarely

One limit on all of them: tone lives in the framing, never in the finding. Anything serious (money held, a booking at risk, anything legal, insurance or safety) is said straight, with no colour. Statuses are written to be heard: full month names, plain times, no database ids or file paths.

When a card says something went wrong

Card shows	Means	Do
Waiting on you	she needs a decision only you can make	read the card and answer
failed	the run went wrong, or the card is a logging artefact	read the detail: a real failure says what broke
Stopped mid-run	the run was cut off, usually by a permission prompt nobody answered	in the Claude app's scheduled routines, choose **Run now**
No standup filed / **gone quiet**	nothing filed recently	check the computer was on, then **Run now**

A card can also carry the value `status`. That is the daily card itself, not a state. There are many of these and they are correct.

7.5 Who checks whom

Everything routes through Pearl. Coral reports to Siren, Siren to Pearl, and Pearl to you. The one loop that runs backwards is Coral checking what Siren actually published, because Siren is the only agent whose mistakes go public. Joy, Reef and Nova are deliberately not reviewed: putting a reviewer in front of an agent that only proposes adds delay and no safety.

Pearl reports upward to the owner's main assistant, which coordinates this business alongside the owner's other projects.

7.6 Where their instructions live, and how to change them

Everything the crew reads is in `AI & Website\Crew` in the business folder, backed up by Google Drive:

Folder	Holds
`_Global Rules`	the rulebook every agent reads first (`00`), rulebook topics opened when needed (`10`–`13`), and pages on the business, the owner, releases, and files and Drive (`20`–`23`)
`Nauti <Name>`	one per agent: **Briefing** (what, when, why), **Voice**, **Skills** (one file per part of the job), **References**
`_Routines`	the standup and Comment Watch
`_Scripts`	every command the crew runs, with a map of who uses which
`_Old`	the instructions as they were before this layout, kept as history

Each scheduled task's own instructions file (`SKILL.md`) is only a list: which Crew files to read every run, and which only when needed.

To change what an agent does:

1. Edit her file in the Crew folder, not the list.
2. Run the consistency check (see 9.4). It fails if a list names a missing file, or if a Crew file is listed nowhere and so would never be read.
3. A change to how an agent works is a revision; it goes out with the next release.

7.7 Working with Claude

Beyond the scheduled crew, you can work with Claude directly in a session on the office computer. It reads the same Crew folder and the same database.

- **Forward a guest's enquiry** (a screenshot is enough) and it logs the booking and drafts your reply.
- **Ask for a resync** when a payment and a booking disagree.
- **Ask for a change** to the website or a crew instruction. It will make the change, check it, and ask before cutting a release.

Part 8 — Fleet and on the water

8.1 Boats and docks

Each boat is set up in the system with its capacity, its slip, whether it has an engine-hour meter, and its dock position. **Each boat can live at its own dock**, so the meeting point, the run-for-home weather check and the confirmation email are all worked out per boat, never from one business-wide address. This fleet's boats and docks are in Appendix C.

8.2 The On the dock page

📱 **On the dock** (`/admin/ask`) is built for a phone at the boat. Add it to your home screen. If you are not signed in it asks for the passcode.

At the top, a strip shows the charter **on the water now** or **up next**: countdown, guest, boat, party size, hours, when it is due back, add-ons, and a tap-to-call number.

Four tabs: 🌦 **Weather**, **Arriving**, **Reviews**, **Boat log**.

Weather: can I get back before it hits?

The weather check runs when the page opens, using your phone's location and the boat that is out (or next out). **Can I get back before it hits?** runs it again.

Verdict	Means
clear	nothing wet in the window
go	rain is coming and you have 20 minutes or more to spare
tight	under 20 minutes to spare: go now
shelter	you will not beat it; find cover
unknown / **unavailable**	no position, or the forecast could not be reached

It also shows the distance and bearing to that boat's dock, minutes home, wind and gusts, a three-hour rain strip and the radar map.

It is weather timing, not navigation. It does not know where stumps, shallows or no-wake zones are.

Nearest places. Save useful spots from the water (fuel docks, covered shelter, ramps, hazards) with **save this spot**, from your position, a tap on the map or typed coordinates. When rain is near, covered shelter is listed first. Each boat's **dock** is set here too, from your position or typed coordinates, after a confirmation.

8.3 Arriving guests and the gate code

Arriving lists today's and tomorrow's booked charters, earliest first.

Text the gate code opens a message to the guest with the dock address, the gate code, parking, and when to arrive. It is marked sent the moment you tap it, shown as ✓*Sent* with an **undo** link.

- **The gate code is only ever sent by text, on the day.** It is never emailed and is not stored in any file: it is set as a private setting on the website. If it is not set, the tab warns you.
- Tap the number line to choose which number to text, set a default, or add another person's number to the booking. If the booking has no number, the first one you add becomes its phone.
- Phone only: on a computer the button explains and does nothing.

8.4 Reviews on the phone

Reviews lists completed charters with a phone number, warmest first, labelled by how fresh the trip is:

Label	Days since the trip
Ask now	up to 3
Good window	up to 14
Late but fine	up to 90
Cold	over 90

Each guest has **Text <name>** (opens the message and marks them asked), **Copy wording**, and **Mark asked** (records it without texting). **Asked** lists who has been asked, with **Undo**. At the foot is a script for asking in person and a link to your review page.

8.5 Boat log: hours, fuel and service

Engine hours. Pick the boat. For a boat with an hour meter, enter the meter reading; for one without, enter the hours run this trip, which are added to its total. **Log it** saves the entry. A reading lower than the last one is refused.

Fuel. Pick the boat, enter gallons and/or the dollar total, optionally the hours at fill-up and a note, then **Log the fill-up**. **A dollar total writes the fuel expense into the ledger.**

Service checks. Items are grouped by boat. Tap one to confirm it was done today at the boat's current hours.

Logging works from a computer too; only the texting buttons need a phone.

8.6 Maintenance

Boat → Maintenance holds each boat's service items, tracked against elapsed months or engine hours, plus the hours and fuel history. Items turn overdue on their own.

Nothing hour-based can be judged until hours are logged. Until readings exist, the panel shows *nothing overdue*, which looks exactly like a healthy fleet. The Overview says *No maintenance can be judged* instead. Log hours after every outing (see 8.5) and the intervals work on their own.

Part 9 — Running and protecting the system

9.1 Versions and releases

The version badge says which release you are running. It exists for one moment: something is wrong and you need to know what to go back to.

The crew doing their job is not a revision. Drafting, publishing, filing a status, a booking landing, a photo being tagged: that is the system running. A revision is the system itself changing.

Size	Moves	When
Small	2.13.0 → 2.13.1	wording, formatting, a colour or a label. Nothing behaves differently.
Moderate	2.13.0 → 2.14.0	an agent's logic or a workflow changes
Large	2.13.0 → 3.0.0	a whole layout, or a new large-scale idea

Always three numbers. Unsure between two sizes? Take the smaller.

Nobody cuts a release without asking you. A release draws a line under a batch of work and only you know where the batch ends. The routine is: finish the work, say what changed and what size it looks, and ask *"are you done with changes?"*

A release produces:

1. a version number in the code, tagged on GitHub, kept forever;
2. one compressed backup in `AI & Website\releases`, holding everything the code does not: the crew's instructions and scripts, the schedules, the permission rules, the hand-written skills, this manual and the database structure. Only the newest is kept, and only once it exists;
3. an entry in `CHANGELOG.md`, written to be read on a bad day. If it cannot tell you whether to go back to that version, it is not finished.

The full rules are in `AI & Website\VERSIONING.md`.

9.2 Where everything lives

What	Where	Backed up by
Business files: finance, legal, releases, finished photos and videos	`Documents\_MyFiles\_The Nauti Yachti LLC`	Google Drive
The photo library, raw footage included	an external drive, named in the crew's `nauti-paths.json`	**nothing**: it is the only copy of the raw footage; the finished work is also in Drive
The crew's instructions and scripts	`…\AI & Website\Crew`	Google Drive
The website and console code	`Documents\Nauti-yachti-app`	GitHub, every version tagged
The libraries the crew scripts need	`C:\Users\<you>\.node_modules`	nothing; rebuilt after a restore (see 9.3)
Keys and passwords	a private secrets file outside every synced folder	**nothing**: keep your own copy somewhere safe
Bookings, money, posts	the Supabase database	Supabase, plus snapshots in `AI & Website\db-backups`

Google Drive cannot sync a code project. A folder holding `.git`, `node_modules` or build output makes Drive give up on the whole folder, and nothing announces it beyond a red mark. So code lives outside Drive, and the consistency check refuses a release if any of those turn up in the business folder.

Never write a video straight into a Drive folder. Drive can start uploading a file that is still being written and get stuck with an empty copy in the cloud. Render into a scratch folder and move the finished file in. The montage tool does this already.

Outdated files go into `_Old`, not the bin. Most folders have an `_Old` folder; the owner decides later what goes for good. Anything in `_Old` is history, never a current fact.

9.3 Backups and disaster recovery

`AI & Website\DISASTER RECOVERY.md` is the full procedure for rebuilding on a new computer. In outline:

1. Install Node, Git and Google Drive for desktop, and let Drive restore the business folder.
2. Clone the code from GitHub.
3. Restore the crew from the newest release zip; its `RESTORE.md` says which files go where.
4. Rebuild the secrets file. **Nothing else can do this for you.**

5. Rebuild the crew scripts' libraries: copy `Crew\_Scripts\package.json` and `package-lock.json` into an empty folder, run `npm install`, and copy what is inside the new `node_modules` into `C:\Users\<you>\.node_modules`.
6. Recreate the scheduled tasks from the release's `schedules.json`.
7. Run the checks in 9.4.

A release is only as good as its date. If the crew has changed since the last one and no release has been cut, that work exists in one place only.

9.4 The checks that keep it honest

Check	Run	Proves
Consistency	`node scripts/check-consistency.js`	every task a document names exists; every script a brief runs exists; every Crew file is listed and every listed file exists; the console's tabs match this manual; the roster matches the schedules; no document has been pasted into itself; nothing Drive cannot sync is in the business folder; the recovery guide names the newest release
Manual freshness	`node scripts/check-manual-fresh.js`	the PDF behind the **Manual** button matches this text
Tests	the `scripts/test-*.js` files	pricing, add-ons, bookings, the board, triage rules and more each behave as intended
The morning output check	run by Pearl every morning	nothing is hurting a guest right now: unpaid confirmed bookings, money not on the books, duplicates, missed confirmations
Health check	`node scripts/health-check.js`	every outside service answers

All of them should be clean before a release.

9.5 Setup: packages, add-ons and coupons

Setup → Packages & pricing. Each package's pricing type and prices: per-package prices, per-guest rates, and the hourly grid for each boat, weekday and weekend. **Every change is logged in the price history.** This is the only place a price is ever changed: the website, the payment page and the checkout all read from here.

Setup → Add-ons. Each extra's name, price and description. Which add-ons come free with which package is set in code (`lib/addOns.js`), and `scripts/test-addons.js` checks the pricing after any change.

Setup → Coupons. Each code's discount (a percentage or a fixed amount), end date, usage limit and whether it is for returning guests only. A code with both an end date and a usage limit is one the tap-to-text messages

can offer the whole contact list (see 5.1). Codes kept for particular people should have no end date or no limit, so they are never broadcast.

9.6 Names that look out of date

A few internal names still say "Jarvis", the system's original name, on purpose: the board's database table, the crew's service key and the board's web address. Renaming them would mean changing live infrastructure in exact step for no benefit to anyone. If you see one in an error message, nothing has been forgotten.

Part 10 — Troubleshooting

10.1 Bookings and payments

Symptom	Likely cause	Fix
A guest says they paid; the booking says unpaid	the payment notice from Stripe was missed or arrived before the booking existed	ask Claude to resync it (3.13)
A guest paid and got no confirmation	no email on file, or a send failed	resync, which sends it; or run `send-missing-confirmations.js`
Text payment link is missing on a row	the row has no package or no price	add both; the button appears
A completed charter has no income	it had no price	add the price; the Overview stops flagging it
Income shows twice for one Boatsetter charter	it is not a duplicate: Boatsetter pays in legs	nothing to fix
The same guest is on the list twice	they were logged by hand and then booked online	judge the pair, then merge (3.8)
A day shows partly booked but no window is shown	a booking on it has no start time	add the time to the booking
A guest says the site told them a boat was not available	the day is blocked, full, or lacks the hours they asked for; or another guest is on the payment page for it	check **Availability**; offer fewer hours, another boat or another date (2.7)
An **ACTION** email: a guest paid for a boat already taken	two guests got through at the same instant, or you logged a booking while they were paying	move them and mark the booking booked, or refund them in Stripe
A refund made in Stripe did not change the booking	the site's webhook is not subscribed to `charge.refunded`	add that event in Stripe under Developers → Webhooks, then set this one by hand
A gift certificate code is refused	it is unknown, voided, expired or used up; the message says which	check it in **Money → Gift certificates**
A coupon's uses ran out faster than bookings	abandoned checkouts count as a use	raise the limit, or watch it
A guest cannot book the seat-sale event; its page says the next date is coming	the night has passed, so sales closed by themselves	give the package its next date when you want to sell (2.6)

Symptom	Likely cause	Fix
A guest was charged twice for one booking	two checkouts, both paid: a known, accepted limit	refund the second charge in Stripe, then cancel the extra row by hand (2.2)
Undid a completion by mistake and income is still there	income is not removed when the status changes back	delete that ledger row by hand
A guest says their trip page link does not work	it was copied incompletely	send it again from **trip page ↗** on their row, or have them use `/trip` (2.8)
A guest cannot get in at `/trip`	the phone they typed is not on the booking	add their number to the booking, or send them the link

10.2 Posts, comments and messages

Symptom	Likely cause	Fix
An approved post never went out	it has no date	give it one with **Reschedule**
A scheduled post never went out	more than five hashtags, no media, or a photo on TikTok	open **Discuss** on the card, or check the publisher's note
The publishing service emails "your post has failed to publish"	often only the Story leg failed (a video that was not upright)	check the feed before worrying
A comment or message stays red after you answered it	you answered in the app, which this screen cannot see	**I answered this elsewhere**
A message has a red **Answered automatically** flag	the keyword auto-reply answered something it should not have	read what went out, then reply yourself
TikTok comments are not in the console	the publishing service cannot read them	check them in the TikTok app

10.3 The crew

Symptom	Likely cause	Fix
A card says **Stopped mid-run**	a permission prompt nobody answered, or the computer slept	**Run now** in the Claude app's scheduled routines
A card says **failed** but the work got done	a logging artefact	read the card's detail; an artefact has a status word where the title belongs
No runs at all this morning	the office computer was off or asleep	wake it; each task runs at its next time, or use **Run now**
An agent ignores a new skill file you added	the file is not on her list	add it to her `SKILL.md` list; the consistency check reports unlisted files

10.4 Files, email and the system

Symptom	Likely cause	Fix
A folder shows a red mark in Explorer	Google Drive cannot sync something in it: a code folder, or a file stuck mid-upload	see 9.2; never write videos straight into Drive
A reply sent to the bookings address vanished	that address can send but cannot receive	replies go to the business Gmail address
A file's date looks wrong	names can record when a file was saved, not when it was shot	trust the date inside the file, not its name
The bank balance looks old	it is a reading typed in, not a live figure; amber after a week	record a new reading
The consistency check fails	a document, task or file no longer matches the system	read its message: it names the file and the line to fix
The share page or a trip page says uploads are not switched on	the website's settings lack the storage keys	add `SUPABASE_URL` and `SUPABASE_SERVICE_ROLE_KEY` to the website's settings and to the secrets file on the office computer, then redeploy

Appendices

Appendix A — Quick reference

I want to…	Go to
see what needs me today	Overview → **Needs attention**
log a booking from a text or call	Bookings → Bookings, or forward it to Claude
send a guest a payment link	Bookings → Bookings → **Text payment link** (phone)
record that a charter happened	Bookings → Bookings, set **completed** (writes the income)
block a day	Bookings → Availability
text a past guest about an offer	Bookings → Contacts (phone)
log a receipt	Money → Income & expenses
check a charter's money is on the books	Money → Reconciliation
pull tax figures	Money → Tax Report
approve, move or stop a post	Marketing → Media Drafts
answer a comment or message	Marketing → Comments / Messages
ask for a Google review	On the dock → Reviews (phone)
send the gate code	On the dock → Arriving (phone)
log hours, fuel or a service	On the dock → Boat log
change a price	Setup → Packages & pricing
make a coupon	Setup → Coupons
change what an agent does	`AI & Website\Crew`, then the consistency check

Appendix B — Glossary

Term	Meaning
Inquiry	someone asked about a charter; not yet booked
Booked	confirmed and holding its date, paid or not
Lapsed	an inquiry that never became a booking
Owed	paid for, never sailed, no new date yet
Tentative seat	a seat on a seat-sale event held by an inquiry, a lapsed inquiry or an owed charter: counted against capacity, shown apart from confirmed
Completed	the charter ran; its income is written
Refunded	it was a booking, and the money has gone back
Hold	the 35 minutes a guest on the payment page keeps their boat and hours
Booking number	`NY-YYYYMMDD-NN`; never changes
Trip page	a guest's own page for one booking, opened by a signed link; anyone holding the link can use it
Mirror row	the Bookings row created for a website booking, sharing its number with the inquiry
Lead source	where the guest found you
Booking channel	who took the booking: a platform, the website, or you directly
How paid / origin	how the money arrived, on the booking and on each ledger row
Held, not earned	money taken for a trip that has not happened
Draft	a social post waiting for a decision
Scheduled	an approved, dated post: publishes on its own
The Board	the shared to-do list between you and the crew
T1 / T2 / T3	how urgent a board item is: urgent, worth your attention, background
Launcher	an agent's `SKILL.md`: the list of Crew files she reads
Release	a numbered, backed-up version of the whole system

Term	Meaning
`_Old`	a folder for retired files; history, never current fact

Appendix C — This installation: The Nauti Yachti

Everything in this appendix belongs to this one business. A new operator replaces it (see Appendix D).

The business. The Nauti Yachti LLC runs captained charters on Lake Conroe, Texas. Registration numbers are in `01 Formation & Legal\Business Information - The Nauti Yachti LLC`.

The fleet. Capacities include the captain. The live figures are in the database.

Boat	Type	Capacity (guests)	Dock	Hour meter
Nauti Explorer	Monterey Explorer deck boat, red, white and blue	14 (13)	Pearl Bay, east side: a gated private dock	no
Nauti Yachti	2006 Sea Ray 290 Sundancer	12 (11)	about three miles west-southwest of Pearl Bay	yes
Nauti Islander	make and model not recorded yet	8 (7)	with the Yachti	no

The Explorer's port side still carries its previous owner's name, "Canter Splash". It is our boat and its photos are fine to post. Dock addresses are private settings on the website, one per boat; the gate code is set the same way and sent only by text.

Packages. Tubing / Wakeboarding (the default when no occasion is named), Birthday Party, Bachelor / Bachelorette, Corporate Outing, Night Cruise, Party Cove Package (all priced by the hour, by boat), Wake Surfing Lessons (priced by group size), and **Boatz & Glowz** (a glow-party night sold by the seat).

Add-ons, as of October 2026 (live prices in Setup → Add-ons):

Add-on	Price	Free with
Balloon Package	$40	Birthday Party
Champagne on Ice	$25	Bachelor / Bachelorette
Full Decoration Package	$60	— (includes the balloons and the champagne)
Grill Service	$25	Night Cruise. Cooking only; the guest brings the food, and the boat must be at anchor.

The glow night. Boatz & Glowz is this installation's seat-sale event (2.6): 31 guest seats across the three boats. It meets at **Scott's Ridge boat ramp** for every boat. Check-in 4:30pm, lines off 5:00pm, back around midnight, 21 and over. The times live in `lib/glowEvent.js`; change them there and never in copy.

Seat sales closed after the night of 19 September 2026. There is no next date yet: the owner's call, possibly May. Until one is set, the page collects crew-list signups only, and the crew offer no seats, prices or seat counts in posts or replies.

The lake. Charters stop at three places, which are different places: **Party Cove** (the raft-up), **the Island** (beaching and swimming) and **the Dam**.

Text booking requests (3.6): Brooke is authorised to request charters by text through the assistant line (your decision, 4 October 2026).

Media rules specific to this business:

- The **Lake Bryan charters of June 2026 are under a confidentiality agreement**: no media from them, ever.
- One glow clip from September 2025 is withdrawn for nudity, and another is held. Both are on the `doNotUse` list until you decide; media that can never be used is yours to delete.
- The sold **Nauti Lexi** may appear in old footage but is never offered as a boat to book.
- All faces are allowed, strangers included.

Accounts.

- Instagram posts tag the owner's personal accounts as collaborators, set in `lib/socialPosting.js`.
- The automatic message reply is two automations in the publishing service.
- `bookings@thenautiyachti.com` sends but cannot receive. Replies go to the business Gmail address.
- Banking is moving to a new business checking account in October 2026; see the board for the console's account warning, which needs updating to match.

Prices on the booking platforms are managed on the platforms themselves, separately from the website's prices.

Appendix D — Setting this up for another business

This system is built to be handed to another charter operator. **What transfers is the machinery**: the website, the console, the booking and payment logic, the ledger, the media pipeline and the AI crew. **What does not transfer is the business**: boats, prices, photos, guests and accounts.

What a new operator replaces:

Replace	Where
name, domain, lake, phone	`business.config.json`, then `node setup.js` (dry run) and `node setup.js --apply`
boats, packages, prices	the database seed, then **Setup** in the console
the words on the site	`lib/packageContent.js` and `lib/faqContent.js`
photos	the Photos library, tagged rather than re-filed
keys and accounts	a new secrets file and the website's private settings
trip page links	the web address in `lib/tripLink.js`, and a `TRIP_LINK_SECRET` of their own
this manual's Appendix C	rewritten for their business
the crew's business pages	`Crew\_Global Rules\20 The business.md` and `21 The owner…`
crew names and voices	optional: the setup step can rename them

What never goes with it: guest data, database backups, release archives of this business, and this business's photographs. The distribution build leaves all of these out and refuses any file that contains a key.

Before a new operator takes a booking: run the consistency check and the health check. Both should be clean.

Known spots that still carry this business's details in code, to clear before distributing: the gate-code text's signature, one Overview footnote, and the phone number in the trip page's error messages. The first two are on the board.
